

## LESSON: River Crossing (Grades 2-3, 7-8)

### + OVERVIEW

[This Photo](#) by Unknown Author is licensed under [CC BY-SA](#)

In this design challenge, students will learn about the history of westward expansion in the United States and the difficulties migrants faced during their journeys. Students will be presented with a scenario, which is crossing a river with all of their belongings, that many migrants faced when traveling west. The students will be presented with the following problem: In search of new beginnings, the Jacksons are on a journey to West Texas. However, they have come across a river that is too deep to cross with their wagon alone. The Jacksons must figure out

how to get across the river to continue their journey. Students will put on their engineering hats to build a bridge that can safely deliver travelers across the river. Bonus points will be awarded to those who can add additional cargo to their wagon and successfully travel across the river.

### + 2021 Science TEKS covered in this design challenge

Grade 2 TEKS: 2.1.B, 2.1.E, 2.1.G, 2.2.D, 2.6.A, 2.6.C

Grade 3 TEKS: 3.1.B, 3.1.E, 3.1.G, 3.2.D, 3.6.D, 3.7.B

Grade 7 TEKS: 7.1.B, 7.1.E, 7.1.G, 7.2.D, 7.7.D

Grade 8 TEKS: 8.1.B, 8.1.E, 8.1.G, 8.2.D, 8.7.B

### + Social Studies TEKS covered in this design challenge

Grade 7 TEKS: 7.10.A

Grade 8 TEKS: 8.6.B

**+Math TEKS covered in this design challenge**

Grade 2 TEKS 2.2.B, 2.4.A, 2.9.D

Grade 3 TEKS 3.4.A, 3.4.G

**+ The students will be able to meet the following objectives:**

- > Explain how physical properties can be changed through processes such as cutting, folding, sanding, melting, or freezing
- > Demonstrate and explain how position and motion can be changed by pushing and pulling objects such as swings, balls, and wagons
- > Combine materials to make a strong structure
- > Demonstrate that small units can be combined or reassembled to form new objects for different purposes
- > Explain the materials chosen based on their physical properties
- > Add and subtract up to 100
- > Multiply a two-digit number by a one-digit number
- > Solve problems that deal with money
- > Identify why migrant groups came to Texas and where they settled
- > Understand the westward growth of the United States, including the Louisiana Purchase and Manifest Destiny
- > Solve a problem using the engineering design process

**+ Students will use the following STEM fluency skills:**

- > Communication
- > Collaboration
- > Creativity
- > Critical Thinking
- > Resilience
- > Time/Resource Management
- > Innovation
- > Adaptability

**+ Materials needed for this design challenge:**

|                         | <b>Grade 2</b>    | <b>Grades 3, 7-8</b> |
|-------------------------|-------------------|----------------------|
| > Wagon                 | Free              | Free                 |
| > Cart                  | Free              | N/A                  |
| > Small Popsicle Sticks | 1 counter for 10  | \$10 for 10          |
| > Large Popsicle Sticks | 3 counters for 10 | \$30 for 10          |
| > Straws                | 1 counter         | \$10                 |
| > Glue                  | 2 counters        | \$20                 |
| > Tape                  | 3 counters        | \$30                 |
| > Rubber Bands          | 1 counter for 10  | \$10 for 10          |
| > Chenille Stick        | 1 counter         | \$10                 |
| > String                | 1 per 12 inches   | \$10 per 12 inches   |
| > Foam Sheet            | 2 counters        | \$20                 |
| > Scissors              | 2 counters        | \$20                 |

**+ Facilitator materials:**

- > Projector and computer
- > Slide deck for the lesson
- > Copies of the scorecard for each group
- > Two stacks of textbooks
- > Toy car or wagon with a string attached to pull
- > Cart to be attached to a wagon (for grade 2 only)
- > Weights to be used for the carts
- > Ruler to measure out the string

**+ FACILITATION GUIDE**

| SECTION             | PROCEDURE                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>INTRODUCTION</b> | <p><b>Slide 1: River Crossing</b></p> <ul style="list-style-type: none"> <li>&gt; Introduce today's lesson on bridges and crossing rivers.</li> </ul> <p><b>Slide 2: Westward Expansion</b></p> <ul style="list-style-type: none"> <li>&gt; Ask students to look at the map of the United States in 1800.</li> <li>&gt; Explain to students that, at this time, most people were farming or making goods that needed to be sold to other areas of the United States and to other countries.</li> <li>&gt; Ask students the question: What difficulties do you think farmers in western Kentucky faced that wouldn't be experienced in coastal states? <ul style="list-style-type: none"> <li>▪ Explain to students that some trading occurred overseas, which meant getting their crops or goods to a port city on a coast. Transporting goods over land was a timely and costly process.</li> <li>▪ Explain to students that one result of the Louisiana Purchase was to help give non-coastal states access to the Mississippi River and its port in New Orleans, Louisiana.</li> </ul> </li> <li>&gt; Ask students the question: Why, after the Louisiana Purchase, did more people move west? <ul style="list-style-type: none"> <li>▪ Explain to students that from 1800 to 1860, the West held opportunities for people to make more money and create a new life for themselves.</li> <li>▪ Many groups moved to the West in search of new opportunities. For example, some African Americans moved to establish new lives for their families after the Civil War. Ask students the question: With people moving west into unsettled regions, what difficulties do you think they experienced? Explain to students that much of this region was not developed, meaning there were few roads to travel on, shelters to stop at, or places to restock food. Many would also have to cross rivers along their travels that were too deep for their wagons to cross.</li> </ul> </li> </ul> <p><b>Slide 3: Types of Bridges</b></p> <ul style="list-style-type: none"> <li>&gt; Ask students if they know of any famous bridges. What is the purpose of a bridge? What do the bridges you have seen look like? <ul style="list-style-type: none"> <li>▪ Explain that there are seven main types of bridges: arch, beam, cable-stayed, cantilever, suspension, truss, and tied arch.</li> <li>▪ Go over each type of bridge with students and ask if they remember seeing a similar type of bridge somewhere before. <ul style="list-style-type: none"> <li>• The arch bridge is comprised of an arch supported on either end by supports called abutments.</li> <li>• The beam bridge consists of a horizontal beam that is supported at each end by piers.</li> </ul> </li> </ul> </li> </ul> |

- The cable-stayed bridge includes one or more towers with cables (stays) connecting directly to the bridge deck.
- The cantilever bridge uses horizontal beams that are supported at only one end, usually a pier.
- The suspension bridge includes a roadway suspended by cables. The main cables are attached to towers at each end of the structure.
- The truss bridge structure is composed of many connecting elements, usually forming triangular units.
- The tied arch bridge combines features of beam and suspension bridges. There is usually an arch above the roadway, with cables that connect directly to the roadway.
- Ask students what they think is the strongest bridge type. (Truss is considered the strongest type when considering strength-to-weight ratio.)
- Explain to students that each type of bridge has advantages and disadvantages. For example, a beam bridge is the simplest and quickest to build; a suspension bridge allows for greater heights and longer spans; and a truss bridge offers high strength.

#### **Slide 4: Engineering Design 1**

- > Ask students the question. What is engineering?
  - Explain to students that engineering is when engineers take what they know and apply it to solve problems by designing a product or process.
  - For example, phones could only be used at home or in specific locations. Why is this a problem? (Needing to make a call outside the home). What solution did engineers design to fix that problem? (Cell phones).
    - *Teacher's Note: Any example can be used here, but focus on examples that students are familiar with.*

#### **Slide 5: Engineering Design 2**

- > Ask students the question. What are some examples of engineering jobs?
  - *Teacher's Note: If students have trouble giving examples, ask students who they think makes the things they use. Who makes refrigerators, cars, helmets, cell phones, and sneakers?*

#### **Slides 6-7: STEM Careers**

- > Show students pictures related to careers connected to the challenge.
- > Structural Engineering
  - Ask students what they see in the pictures.
  - Structural engineers ensure that buildings and bridges can meet the intended design loads and withstand environmental effects like salt, strong winds, earthquakes, rain, and snow. When working on bridges,

structural engineers ensure they continue to function long after they are built.

> Geotechnical Engineering

- Ask students what they see in the pictures.
- Geotechnical engineers use their knowledge of soil and rock to solve problems. By understanding the land, subsurface materials, and conditions, geotechnical engineers can determine how best to support a bridge during construction.

**Slides 8-9: Try the Trade**

> Carpentry

- Ask students what they see in the pictures.
- Explain to students that these are carpenters at work. Ask students what they think a carpenter does. Explain that carpenters build strong structures such as homes, furniture, playgrounds, and wooden bridges.
- Ask students why it is important for homes to be built carefully and with strong materials. Explain that carpenters must think about strength, stability, and safety when designing structures. If a product is poorly built, strong winds, storms, or other forces could damage it.

> Construction Inspection

- Ask students what they see in the pictures.
- Explain to students that these are construction inspectors at work. Ask students what they think a construction inspector does. Explain that construction inspectors check projects during and after construction to make sure they are safe, follow the plans, and meet all requirements.
- Ask students why it is important to test and inspect something before it is used. Explain that construction inspectors look for problems, identify safety concerns, and make sure the project is built correctly and works as intended.
- Explain to students that engineers design and build solutions, while inspectors carefully examine the work to make sure it is safe and meets the project goals.

**Slide 10: Engineering Design 3**

- > Ask students the question: Who can be an engineer?
  - Anyone!

**Slide 11: Engineering Design Process**

- > Ask students if they think all engineers solve their problems in one try. Explain to students that it takes many tries to get something correct in engineering. In engineering, there is no such thing as a mistake; there are only opportunities to learn. It is okay to fail. Just find the mistake and correct it. In engineering, there is never one correct solution. There are always many solutions to a problem, and there are always improvements that can be made. The steps that engineers take to find these solutions are called the *engineering design process*.

- > Ask students to read the first big step (Identify).
  - What does identify mean? (To point out or find). Engineers design solutions: what do they need to know first to find the answer? (The problem)
  - How do people know when they have found the correct answer? In engineering, there are no correct answers, just better ones. Explain to students that there are expectations that engineers must meet, called *criteria*. For example, when engineering a football, what does a football need to do? (Bounce, look a certain way, have laces, have air inside, etc.). Those things are all called criteria. By comparing the design to the criteria, an engineer knows a solution will work. Is a child-sized football the same as an adult football? The criteria for both footballs include leather, white laces for the fingers, and shape. However, the two footballs would have different size criteria. The footballs are similar but differ in certain criteria.
  - Once the criteria are understood for the design challenge, what could make it difficult for an engineer to design their solution? (Money, time, materials, etc.) Explain to students that these rules are called *constraints* or rules that engineers must follow. Engineers are given constraints they must follow when solving a problem. Think about football again. What are college and professional footballs made from? (Leather). What if, instead, the rule (or constraint) was not to use leather? Could another type of football be made instead? Many of the footballs for sale are made of rubber because the engineer had different constraints.
- > Ask students to read the next step (Imagine).
  - Ask students what imagine, or imagination, means. Are these things real or tangible? They may not be real, but they help us imagine what things could be. In this step, see what materials are available, then brainstorm possible ideas/solutions to the problems.
  - Explain to students that there are no right answers in engineering. Start with as many ideas as possible.
- > Ask students to read the next step (Plan).
  - The third big step of the engineering design process is to plan out the idea. Make sure that what is designed can be repeated. A plan will help an engineer identify where mistakes happen so they can be fixed.
  - When planning, begin with the brainstorming phase. Each team member will contribute their ideas, and then the team will combine the different ideas!
  - Once ideas are combined into a single group idea, determine what materials will be used for the solution and make sure the design meets the criteria and constraints of the project.
- > Ask students to read the next step (Create).
  - The fourth step is to create! Since this is the very first creation, it is called a *prototype*. A prototype is a first or preliminary model of something from which other forms are developed or copied. A

|                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                 | <p>prototype is created to test the engineer's idea or concept. Engineers ask themselves, "Did the idea work the way we wanted it to?" After testing the idea, the engineer will make improvements to the prototype.</p> <ul style="list-style-type: none"> <li>&gt; Ask students to read the last step (Improve). <ul style="list-style-type: none"> <li>▪ Finally, the last step is to improve. How does an engineer know if the prototype did well on the test? It must meet certain expectations and follow some rules. But how do engineers determine how well it met expectations and followed the rules? In school, how do you know if you mastered something? (Grades). The prototypes made today will be scored using a scorecard or rubric. By looking at the score, each team will determine if the design could be better. If improvements are needed, the team will revisit the plan and decide how to improve the score. Remember, there are no correct answers in engineering, just better solutions.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>IDENTIFY</b> | <p><b>Slides 12-13: Identify – Problem</b></p> <ul style="list-style-type: none"> <li>&gt; Have students read the bolded section. <ul style="list-style-type: none"> <li>▪ Ask students to <i>identify the problem</i>.</li> </ul> </li> <li>&gt; Explain to students that they will put on their engineering hats to build a bridge that will allow people to travel across the river safely.</li> </ul> <p><b>Slide 14: Identify – Criteria (Desired Outcomes)</b></p> <ul style="list-style-type: none"> <li>&gt; Ask students what criteria or desired outcomes mean. <ul style="list-style-type: none"> <li>▪ Explain to students that these criteria are what engineers use to determine if they are successful.</li> </ul> </li> <li>&gt; Ask students what determines if the solution is successful today. <ul style="list-style-type: none"> <li>▪ A successful bridge design should meet the following criteria: <ul style="list-style-type: none"> <li>• Spans across the river</li> <li>• Support the weight of the wagon and cart</li> <li>• Allow for the transportation of the wagon and cart</li> <li>• Stay together while being used</li> </ul> <p>Bonus points will be awarded if the bridge can support heavier loads.</p> <ul style="list-style-type: none"> <li>○ <i>Teacher's Note: For grades 3, 7, and 8, students will not be given a cart for their wagon. They will need to build the cart that attaches to the wagon, as well as the bridge.</i></li> </ul> </li> </ul> </li> </ul> <p><b>Slides 15-18: Identify – Constraints (Limitations)</b><br/>*DELETE OTHER GRADE SLIDES*</p> <ul style="list-style-type: none"> <li>&gt; Ask students what constraints or limitations mean. <ul style="list-style-type: none"> <li>▪ Explain to students that those constraints are rules the engineers must follow.</li> </ul> </li> <li>&gt; Explain that the constraints for this engineering design activity are the following:</li> </ul> |

- Time Limit: Students will have 30 minutes to build the bridge (and cart for grades 3, 7, and 8).
- Materials: Students may only use the available materials.
- Budget: Students will have \$200 to complete this challenge.
  - *Teacher's Note: For grade 2, 10 counters will be given to each group. Pre-bag the counters for easy distribution to each group. When students go to the supply table, they will hand the teacher one counter for each item they buy.*
- Collaboration: One design element from each team member must be used in the final design. Explain to students that a design element is taking one part of someone's idea and adding it to another.
- Redesign: Each team can test their prototype as many times as needed during the 30-minute design phase. Remind students what a prototype is. It is the first creation of our design.
  - *Teacher's Note: When a team is ready to test their design, they should raise their hand, and the teacher should assist the team with their score. If the team receives a low score on any part of the design, the team should redesign if they still have time.*

## IMAGINE

### Slides 19-20: Imagine – Explore Materials

*\*DELETE OTHER GRADE SLIDE\**

- > Students will be presented with the materials needed to build their bridge (and cart for grades 3, 7, and 8). The teacher will hold up the wagon that will be used. It will be attached to the demonstration cart. The teacher or facilitator should show how the wagon and cart will travel by pulling the wagon with a string. Let students know that additional points are available if their bridge can support more weight on the cart.
  - *Teacher's Note: It is up to the teacher to determine how to represent the river. The easiest method would be to stack textbooks to create the width of the river to be crossed and maintain a dry environment (see Image 1 below). A tub of water can also be used, with stacked textbooks placed at the end of the tub, to model a river crossing (see Image 2 below).*
    - Image 1

- Image 2

#### Slide 21: Imagine – Brainstorm

- > Give students one minute to individually design and draw a plan of what they think their bridge (and cart for grades 3, 7, and 8) should look like. Emphasize that students should not talk during this minute or share ideas. Remind students that their ideas will be used as design elements for the final design.
- > After a minute, give students five minutes to present and share their ideas with their group. Let students know that, when sharing, they should focus on the key aspects of their idea they like and want to use as design elements in the final design.
  - *Teacher's Note: If students are struggling with an idea for their design, provide ideas without giving a solution. For example, "This is a design that I tried earlier but failed. What could I do to improve it?"*  
*Emphasize that the design failed to reinforce that it is okay to fail and to let students know they cannot copy the design and expect success.*

## PLAN

#### Slide 22: Plan – Plan Development

- > Hand out the scorecard that will be used during the design challenge. Review the testing criteria with the class and answer questions. The testing criteria will inform their design decisions.
- > Have students collaborate to come up with a final design. Let students know they must include at least one element from each team member for their final design.
- > Ask students again what the design criteria are:
  - A successful bridge design should include the following:
    - Spans across the river
    - Support the weight of the wagon and cart
    - Allow for the transportation of the wagon and cart
    - Stay together while being used

Bonus points will be awarded if the bridge can support heavier loads.
- > Students will need to select the materials to be used for the design and develop a budget for the project. Students will have \$200 (or 10 counters for grade 2) to purchase materials for their build at the classroom supply table. The prices used in this challenge can be found in the materials list. Students will raise their

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                      | <p>hands when they are ready to purchase materials. The teacher will make sure the appropriate amount of money is spent on purchasing each material, but will not guide students on following their budget. Students can go over budget if they want to, but remind them that they will lose points on their scorecard.</p> <p><b>Slide 23: Plan</b> – Team Member Responsibilities (Career Role-Playing)</p> <ul style="list-style-type: none"> <li>&gt; Assign each student a career role within their team. As students complete the challenge, they should make decisions and contribute from the perspective of their assigned career. This activity models how STEM and skilled trade professionals collaborate in the real world to design, build, test, and improve their prototype. <ul style="list-style-type: none"> <li>▪ <u>Carpenter</u>: Builds the bridge with assistance from the group</li> <li>▪ <u>Construction Inspector</u>: Draws the team's plan for the bridge, ensures it follows the plan, and is safe for use</li> <li>▪ <u>Geotechnical Engineer</u>: Tests that materials are working as planned, keeps track of the building materials, and manages the budget</li> <li>▪ <u>Structural Engineer</u>: Tests the bridge's ability to hold weight and works with the team to make improvements, if needed</li> </ul> </li> </ul> |
| <p><b>CREATE</b></p> | <p><b>Slide 24: Create</b> – Design Your Bridge</p> <ul style="list-style-type: none"> <li>&gt; Let students know to have fun, be creative with their designs, and work together.</li> <li>&gt; Remind students that being an engineer is not about getting the solution on the first try. There is no right answer, just better solutions.</li> </ul> <p><b>Slide 25: Identify</b> – Criteria</p> <ul style="list-style-type: none"> <li>&gt; Display the reminder slide for students to look at while working.</li> </ul> <p><b>Slides 26-29: Create</b> – Test</p> <p><i>*DELETE OTHER GRADE SLIDES*</i></p> <ul style="list-style-type: none"> <li>&gt; Students will calculate their scores when testing in front of the teacher or facilitator. The teacher or facilitator will go through each category on the scorecard with the students. The students will mark their scores and calculate the total.</li> <li>&gt; The teacher or facilitator will recap the point total with the students and how many points the team received for each category to make sure it matches what the students recorded.</li> <li>&gt; Students should explain how they are adjusting to either increase the strength of their bridge (and/or the stability of the cart for grades 3, 7, and 8).</li> </ul>                                                          |

## IMPROVE

### Slide 30: Improve – Redesign: Discussion

- > Students will reflect on their score and discuss:
  - What worked?
    - *Teacher's Note: Focus on the materials being used and ask why they think those materials were helpful. Have students compare designs and see what seems to work best and why. Ask students how they could reinforce their bridge to make it stronger.*
  - What did not work?
    - *Teacher's Note: Focus on the materials being used and ask why they think those materials did not work as well. Have students compare their designs, noting what seemed to create difficulties and why. Ask students where they think the weak points are on their bridge.*
  - What do you want to improve?
    - *Teacher's Note: Focus on engineering aspects with students. Ask students why they were designing a prosthesis. Ask students if they found a solution or just part of one. Reinforce that it is okay not to succeed on the first try and that engineering is about making improvements over time. Ask students if they would design their bridge (and carts) differently if they had no rules. Ask students if working together was difficult. Learning to work together is very important, and it is easier to find a solution with many ideas than with just one.*

This challenge was inspired by a lesson written by Jack Raspberry, an education student at Texas Tech University.
