

Science TEKS Review Work Group B Final Recommendations

Final Recommendations
Texas Essential Knowledge and Skills (TEKS)
Science, High School Courses

The document reflects revisions to the science Texas Essential Knowledge and Skills (TEKS) that have been recommended by the State Board of Education’s TEKS work group for Biology, Chemistry, Integrated Physics and Chemistry, and Physics. Proposed deletions are shown in red font with strikethroughs (~~deletions~~). Text proposed to be moved from its current student expectation is shown in purple italicized font with strikethrough (~~*moved text*~~) and is shown in the proposed new location in purple italicized font with underlines (*new text location*). Additions are shown in green font with underlines (additions). Numbering for the knowledge and skills statements in the document will be finalized when the proposal is prepared to file with the *Texas Register*.

Comments in the right-hand column provide explanations for the proposed changes. The following notations were used as part of the explanations:

MV—multiple viewpoints from within the work group

VA—information added, changed, or deleted to increase vertical alignment

Chemistry	pages 11–21
Integrated Physics and Chemistry	pages 22–28
Physics	pages 29–38

Science TEKS Review Work Group B Final Recommendations

§112.34. Biology, Adopted 2017.		
	TEKS with edits	Work Group Comments
(a)	General requirements. Students shall be awarded one credit for successful completion of this course. Prerequisites: none. This course is recommended for students in Grade 9, 10, or 11.	
(b)	Introduction.	
(1)	Biology. <u>By the end of 12th grade, students are expected to gain sufficient knowledge of the scientific and engineering practices across the disciplines of science to make informed decisions using critical thinking and scientific problem solving. Students in Biology focus on patterns, processes, and relationships of living organisms through four main concepts: biological structures, functions, and processes; mechanisms of genetics; biological evolution; and interdependence within environmental systems.</u> In Biology, students conduct laboratory and field investigations, use scientific practices during investigations, and make informed decisions using critical thinking and scientific problem solving. Students in Biology study a variety of topics that include: structures and functions of cells and viruses; growth and development of organisms; cells, tissues, and organs; nucleic acids and genetics; biological evolution; taxonomy; metabolism and energy transfers in living organisms; living systems; homeostasis; and ecosystems and the environment.	This language is the same across courses. The purpose is to capture the goals of learning science based on the K12 Framework and combine it with what the TEKS already has.
(2)	Nature of science. <u>According to the National Science Teaching Association (NSTA), the “nature of science is a critical component of scientific literacy that enhances students’ understandings of science concepts and enables them to make informed decisions about scientifically-based personal and societal issues.”</u> Science, as defined by the National Academy of Sciences, is the “use of evidence to construct testable explanations and predictions of natural phenomena, as well as the knowledge generated through this process.” This vast body of changing and increasing knowledge is described by physical, mathematical, and conceptual models. Students should know that some questions are outside the realm of science because they deal with phenomena that are not currently scientifically testable.	Used a quotation for nature of science as opposed to a definition of science. The new definition emphasizes literacy.
(3)	<u>Scientific hypotheses and theories. Students are expected to know that:</u>	Added SEs 2.B and 2.C as recommended by the scientific and engineering practices work group. Deleted 2.A. because the content was already addressed above in 2. Definitions help teachers have a shared understanding of these terms.
(A)	<u>hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions are incorporated into theories; and</u>	

Science TEKS Review Work Group B Final Recommendations

(B)	<p><u>scientific theories are based on natural and physical phenomena and are capable of being tested by multiple independent researchers. Unlike hypotheses, scientific theories are well established and highly reliable explanations, but they may be subject to change as new areas of science and new technologies are developed.</u></p>	
(4) (3)	<p>Scientific inquiry. Scientific inquiry is the planned and deliberate investigation of the natural world <u>using scientific and engineering practices</u>. Scientific methods of investigation are experimental, descriptive, or comparative, <u>or experimental</u>. The method chosen should be appropriate to the question being asked. <u>Student learning for different types of investigations is as follows: descriptive investigations involve collecting data and recording observations without making comparisons; comparative investigations involve collecting data with variables that are manipulated to compare results; and experimental investigations involve processes similar to comparative investigations, but a control is identified.</u></p>	<p>Changed order for consistency and intentional ordering of “hierarchy” or types of investigations.</p> <p>Defined types of investigations and scientific and engineering practices as recommended by Work Group A.</p>
(A)	<p><u>Scientific practices. Students should be able to ask questions, plan and conduct investigations to answer questions, and explain phenomena using appropriate tools and models.</u></p>	
(B)	<p><u>Engineering practices. Students should be able to identify problems and design solutions using appropriate tools and models.</u></p>	
(5) (4)	<p>Science and social ethics. Scientific decision making is a way of answering questions about the natural world. <u>Social justice applies the concept of social responsibility to determine if something is ethical.</u> Students should be able to distinguish between scientific decision-making methods (scientific <u>and engineering practices methods</u>) and <u>the use of ethics ethical</u> and social <u>justice to make</u> decisions that involve science (the application of scientific information) <u>and engineering design</u>.</p>	<p>Better defined social ethics.</p> <p>Modernized language by incorporating engineering</p>
(6) (5)	<p><u>Scientific cross-cutting concepts. Science is a series of cross cutting concepts such as Science systems, and models, and patterns. A system is a collection of cycles, structures, and processes that interact. All systems have basic properties that can be described in space, time, energy, and matter. Change and constancy occur in systems as patterns and can be observed, measured, and modeled. These patterns help to make predictions that can be scientifically tested, <u>while models allow for boundary specification and a tool for understanding the ideas presented</u>; Students should analyze a system in terms of its components and how these components relate to each other, to the whole, and to the external environment.</u></p>	<p>To clarify language around systems, define the cross-cutting concepts, and include additional specificity regarding scalability of models.</p>
(7) (6)	<p>Statements containing the word "including" reference content that must be mastered, while those containing the phrase "such as" are intended as possible illustrative examples.</p>	

Science TEKS Review Work Group B Final Recommendations

(c)	Knowledge and skills.	
(1)	Scientific processes. The student, for at least 40% of instructional time, conducts laboratory and field investigations using safe, environmentally appropriate, and ethical practices. The student is expected to:	A separate Scientific and Engineering Practices Work Group developed recommendations for revisions to the current process skills for K-12. Recommendations from the Scientific and Engineering Practices Work Group for proposed new (1)-(4) are posted on the Science TEKS Review Drafts web page .
(A)	demonstrate safe practices during laboratory and field investigations; and	
(B)	demonstrate an understanding of the use and conservation of resources and the proper disposal or recycling of materials.	
(2)	Scientific processes. The student uses scientific practices and equipment during laboratory and field investigations. The student is expected to:	
(A)	know the definition of science and understand that it has limitations, as specified in subsection (b)(2) of this section;	
(B)	know that hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions are incorporated into theories;	
(C)	know scientific theories are based on natural and physical phenomena and are capable of being tested by multiple independent researchers. Unlike hypotheses, scientific theories are well established and highly reliable explanations, but they may be subject to change as new areas of science and new technologies are developed;	
(D)	distinguish between scientific hypotheses and scientific theories;	
(E)	plan and implement descriptive, comparative, and experimental investigations, including asking questions, formulating testable hypotheses, and selecting equipment and technology;	
(F)	collect and organize qualitative and quantitative data and make measurements with accuracy and precision using tools such as data collecting probes, standard laboratory glassware, microscopes, various prepared slides, stereoscopes, metric rulers, balances, gel electrophoresis apparatuses, micropipettes, hand lenses, Celsius thermometers, hot plates, lab notebooks or journals, timing devices, Petri dishes, lab incubators, dissection equipment, meter sticks, and models, diagrams, or samples of biological specimens or structures;	
(G)	analyze, evaluate, make inferences, and predict trends from data; and	

Science TEKS Review Work Group B Final Recommendations

(H)	communicate valid conclusions supported by the data through methods such as lab reports, labeled drawings, graphic organizers, journals, summaries, oral reports, and technology-based reports.	
(3)	Scientific processes. The student uses critical thinking, scientific reasoning, and problem solving to make informed decisions within and outside the classroom. The student is expected to:	
(A)	analyze, evaluate, and critique scientific explanations by using empirical evidence, logical reasoning, and experimental and observational testing, so as to encourage critical thinking by the student;	
(B)	communicate and apply scientific information extracted from various sources such as current events, published journal articles, and marketing materials;	
(C)	draw inferences based on data related to promotional materials for products and services;	
(D)	evaluate the impact of scientific research on society and the environment;	
(E)	evaluate models according to their limitations in representing biological objects or events; and	
(F)	research and describe the history of biology and contributions of scientists.	
(5)	Science concepts--<u>biological structures, functions, and processes</u>. The student knows that <u>biological structures at multiple levels of organization perform specific functions and processes that affect life</u> cells are the basic structures of all living things with specialized parts that perform specific functions and that viruses are different from cells. The student is expected to:	
(A)	relate <u>compare</u> the functions of different types of biomolecules including carbohydrates, lipids, proteins, and nucleic acids <u>to the structure and function of a cell</u> ;	Rationale: revised to place emphasis on how biomolecules are important to cell structure and function. (9)(A)
(B)	compare and contrast prokaryotic and eukaryotic cells, including their complexity, and compare and contrast scientific explanations for cellular complexity;	(4)(A)
(C)	<u>investigate homeostasis through the cellular transport of molecules; and</u> investigate and explain cellular processes, including homeostasis and transport of molecules; and	Rationale: focus on the big idea of homeostasis. (4)(B)

Science TEKS Review Work Group B Final Recommendations

(D)	compare the structures of viruses to cells <u>and explain how viruses spread and cause disease.</u> describe viral reproduction, and describe the role of viruses in causing diseases such as human immunodeficiency virus (HIV) and influenza.	Rationale: viral reproduction (lytic vs. lysogenic cycles) is too much detail; students need to know what viruses are, how they are different from cells, and how they can cause disease. (4)(C)
(6)	Science concepts--<u>biological structures, functions, and processes.</u> The student knows how an organism grows and the importance of cell differentiation. The student is expected to:	
(A)	<u>explain the importance of the cell cycle to the growth of organisms including DNA replication using models</u> describe the stages of the cell cycle, including deoxyribonucleic acid (DNA) replication and mitosis, and the importance of the cell cycle to the growth of organisms;	Rationale: increase rigor with explain; emphasize the big picture of cell cycle importance (5)(A)
(B)	<u>explain the process of cell specialization through cell differentiation including the role of environmental factors; and</u> describe the roles of DNA, ribonucleic acid (RNA), and environmental factors in cell differentiation; and.	Rationale: increase rigor with explain and focus on big picture of cell differentiation and specialization (5)(B)
(C)	<u>relate</u> recognize that disruptions of the cell cycle lead to <u>the development of</u> diseases such as cancer.	Rationale: to increase rigor by changing verb from low-level “recognize” and emphasize the idea of cause-and-effect (5)(C)
(7)	Science concepts--<u>mechanisms of genetics.</u> The student knows the mechanisms of genetics such as the role of nucleic acids <u>in gene expression and the principles of Mendelian and non-Mendelian genetics.</u> The student is expected to:	
(A)	identify components of DNA, <u>explain how the nucleotide sequence specifies the traits of an organism</u> identify how information for specifying the traits of an organism is carried in the DNA, and examine scientific explanations for the origin of DNA;	Rationale: revised to clarify the connection between traits of an organism and the nucleotide sequences in DNA (6)(A)

Science TEKS Review Work Group B Final Recommendations

(B)	<p><u>describe the significance of gene expression and</u> explain the purpose and process of <u>protein synthesis</u> transcription and translation using models of DNA and RNA;</p>	<p>Rationale: revised to place emphasis on the big - picture process of protein synthesis. Gene expression (moved from 6D) is the purpose of protein synthesis.</p> <p>(6)(C)</p>
(C)	<p>identify and illustrate changes in DNA and evaluate the significance of these changes;</p>	<p>(6)(E)</p>
(D)	<p><u>investigate molecular technologies such as PCR, gel electrophoresis, and gene modification that are applicable in current research and engineering practices.</u></p>	<p>Rationale: Provides students the opportunity to apply biological concepts to real-world events and current research that has an impact on their lives. A similar standard was deleted during streamlining in 2017. Also incorporates engineering applications of science.</p> <p>(6)(H)</p>
(8)	<p>Science concepts--<u>mechanisms of genetics</u>. The student knows the mechanisms of genetics such as the role of nucleic acids and the principles of <u>inheritance and variation of traits</u> Mendelian and non-Mendelian genetics. The student is expected to:</p>	
(A)	<p><u>analyze the significance of chromosome reduction, independent assortment, and crossing-over during meiosis in increasing diversity in populations of organisms that reproduce sexually; and</u> recognize the significance of meiosis to sexual reproduction.</p>	<p>Rationale: strengthen verb to make more rigorous; specify significance by identifying three aspects of meiosis; and tie concepts to the diversity of populations.</p> <p>(6)(G)</p>
(B)	<p>predict possible outcomes of various genetic combinations <u>including such as</u> monohybrid crosses, dihybrid crosses, <u>incomplete dominance, codominance, sex-linked traits, and multiple alleles.</u> and non-Mendelian inheritance; and</p>	<p>Rationale: change from “such as” to “including” to make emphasis very clear; delete dihybrid crosses as a requirement for all students; specify the types of non-Mendelian inheritance expected to be taught</p> <p>(6)(F)</p>

Science TEKS Review Work Group B Final Recommendations

(9)	Science concepts--<u>biological evolution</u>. The student knows evolutionary theory is a scientific explanation for the unity and diversity of life <u>that has multiple lines of evidence</u>. The student is expected to:	Rationale: recommendation is to break the SEs into two K&S to distinguish between the evidences of evolution and the mechanisms. Workgroup would be OK if these were all maintained under a single K&S as currently written.
(A)	analyze and evaluate how evidence of common ancestry among groups is provided by the fossil record, biogeography, and homologies, including anatomical, molecular, and developmental; <u>and</u>	(7)(A)
(B)	examine <u>gradualism and punctuated equilibrium as</u> scientific explanations of abrupt appearance and stasis in the fossil record.;	Rationale: workgroup is okay with keeping as is but would like to add more specificity for clarity (7)(B)
(10)	Science concepts--<u>biological evolution</u>. The student knows evolutionary theory is a scientific explanation for the unity and diversity of life <u>that has multiple mechanisms</u>. The student is expected to:	
(A)	<u>explain</u> analyze and evaluate how natural selection produces change in populations; <u>and</u> not <u>in</u> individuals;	Rationale: change verbs to match the level of knowledge expected (7)(C)
(B)	<u>explain and</u> analyze and evaluate how the elements of natural selection, including inherited variation, the potential of a population to produce more offspring than can survive, and a finite supply of environmental resources, result in differential reproductive success;	Rationale: for most students, this will be the first introduction to these ideas and they will lack the necessary background knowledge to evaluate natural selection. It is more appropriate for students to apply the principles of natural selection that are being introduced by explaining how they work. (7)(D)
(C)	analyze and evaluate the relationship of natural selection to adaptation, <u>speciation, and divergent evolution</u> and to the development of diversity in and among species ; and	Rationale: revised to clarify the expectation of what students should know about how diversity is achieved. (7)(E)

Science TEKS Review Work Group B Final Recommendations

(D)	analyze the effect of other evolutionary mechanisms <u>other than natural selection</u> , including genetic drift, gene flow, mutation, and <u>genetic recombination on the gene pool of a population</u> .	Rationale: revised to clarify that these mechanisms are in contrast to natural selection; added effects of mechanisms on populations of organisms. (7)(F)
(11)	Science concepts--<u>biological structures, functions, and processes</u>. The student knows the significance of <u>matter cycling, energy flow, and enzymes</u> various molecules involved in metabolic processes and energy conversions that occur in living organisms. The student is expected to:	
(A)	<u>explain how matter and energy are conserved during photosynthesis and cellular respiration using models, including chemical equations; and</u> compare the reactants and products of photosynthesis and cellular respiration in terms of energy, energy conversions, and matter; and	Rationale: emphasis should be on cycling of matter and transfer of energy (9)(B)
(B)	identify and investigate <u>and explain</u> the role of enzymes <u>in facilitating cellular processes</u> .	Rationale: increase rigor and focus on big picture of enzymes as necessary facilitators of cellular processes (9)(C)
(12)	Science concepts--<u>biological structures, functions, and processes</u>. The student knows that <u>multicellular organisms</u> biological systems are composed of multiple <u>systems that interact to perform complex functions</u> levels. The student is expected to:	
(A)	describe <u>analyze</u> the interactions that occur among systems that perform the functions of regulation, nutrient absorption, reproduction, and defense from injury or illness in animals; <u>and</u>	Rationale: change verb to increase rigor (10)(A)
(B)	<u>explain how the functions of transport, reproduction, and response in plants are facilitated by their structures</u> . describe the interactions that occur among systems that perform the functions of transport, reproduction, and response in plants; and	Rationale: to place emphasis on functions and the big picture of how structure and function support each other. (10)(B)

Science TEKS Review Work Group B Final Recommendations

(13)	<p>Science concepts interdependence within environmental systems. The student knows that interdependence and interactions <u>at various levels of organization</u> occur within an <u>ecosystem environmental system to maintain stability</u>. The student is expected to:</p>	
(A)	<p><u>investigate and evaluate how ecological relationships</u> interpret relationships, including predation, parasitism, commensalism, mutualism, and competition, <u>influence ecosystem stability among organisms</u>;</p>	<p>Rationale: revised to expand on learning in earlier grades and relate concepts to broader ecological systems (12)(A)</p>
(B)	<p><u>analyze how ecosystem stability is affected by disruptions to the cycling of matter and flow of energy through trophic levels using models</u>;</p> <p>analyze the flow of matter and energy through trophic levels using various models, including food chains, food webs, and ecological pyramids;</p>	<p>Rationale: revised to add on to and go deeper than the learning on this topic in middle school. (12)(C)</p>
(C)	<p><u>explain the significance of the carbon and nitrogen cycles to ecosystem stability and analyze the consequences of disrupting these cycles; and</u></p> <p>describe the flow of matter through the carbon and nitrogen cycles and explain the consequences of disrupting these cycles; and</p>	<p>Rationale: revised to focus on the impacts of carbon and nitrogen cycles on ecosystems. (12)(D)</p>
(D)	<p><u>explain how environmental change affects biodiversity and analyze how changes in biodiversity impact ecosystem stability.</u></p> <p>describe how environmental change can impact ecosystem stability.</p>	<p>Rationale: revised to relate biodiversity to environmental stability and connect to environmental changes. Also increases rigor with explain and analyze as verbs. (12)(E)</p>

Science TEKS Review Work Group B Final Recommendations

§112.35. Chemistry (One Credit), Adopted 2017.		
TEKS with edits		Work Group Comments
(a)	<p>General requirements. Students shall be awarded one credit for successful completion of this course. Required prerequisites: one unit of high school science and Algebra I. Suggested prerequisite: completion of or concurrent enrollment in a second year of mathematics. This course is recommended for students in Grade 10, 11, or 12.</p>	
(b)	<p>Introduction.</p>	
(1)	<p>Chemistry. <u>By the end of 12th grade, students are expected to gain sufficient knowledge of the scientific and engineering practices across the disciplines of science to make informed decisions using critical thinking and scientific problem solving.</u> In Chemistry, students conduct laboratory and field investigations, use scientific practices during investigations, and make informed decisions using critical thinking and scientific problem solving. Students study a variety of topics that include characteristics of matter, use of the Periodic Table, development of atomic theory, and chemical bonding, chemical stoichiometry, gas laws, solution chemistry, <u>acid-base chemistry</u>, thermochemistry, and nuclear chemistry. Students will investigate how chemistry is an integral part of our daily lives.</p>	<p>Work group split out acids and bases from solutions.</p>
(2)	<p>Nature of science. <u>According to the National Science Teaching Association (NSTA), the “nature of science is a critical component of scientific literacy that enhances students’ understandings of science concepts and enables them to make informed decisions about scientifically-based personal and societal issues.”</u> Science, as defined by the National Academy of Sciences, is the “use of evidence to construct testable explanations and predictions of natural phenomena, as well as the knowledge generated through this process.” This vast body of changing and increasing knowledge is described by physical, mathematical, and conceptual models. Students should know that some questions are outside the realm of science because they deal with phenomena that are not currently scientifically testable.</p>	<p>Used a quotation for nature of science as opposed to a definition of science. The new definition emphasizes literacy.</p>

Science TEKS Review Work Group B Final Recommendations

(3)	<u>Scientific hypotheses and theories. Students are expected to know that:</u>	<p>Added SEs 2.B and 2.C as recommended by the scientific and engineering practices work group. Deleted 2.A. because the content was already addressed above in 2.</p> <p>Definitions help teachers have a shared understanding of these terms.</p>
(A)	<u>hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions are incorporated into theories; and</u>	
(B)	<u>scientific theories are based on natural and physical phenomena and are capable of being tested by multiple independent researchers. Unlike hypotheses, scientific theories are well established and highly reliable explanations, but they may be subject to change as new areas of science and new technologies are developed.</u>	
(4) (3)	<p>Scientific inquiry. Scientific inquiry is the planned and deliberate investigation of the natural world <u>using scientific and engineering practices</u>. Scientific <u>methods</u> practices of investigation <u>are can be experimental</u>, descriptive, or comparative, <u>or experimental</u>. The method chosen should be appropriate to the question being asked. <u>Student learning for different types of investigations is as follows: descriptive investigations involve collecting data and recording observations without making comparisons; comparative investigations involve collecting data with variables that are manipulated to compare results; experimental investigations involve processes similar to comparative investigations, but a control is identified.</u></p>	<p>Consider how engineering practices can be integrated with scientific inquiry.</p> <p>Changed order for consistency and intentional ordering of “hierarchy” or types of investigations.</p> <p>Defined types of investigations and scientific and engineering practices as recommended by Work Group A.</p>
(A)	<u>Scientific practices. Students should be able to ask questions, plan and conduct investigations to answer questions, and explain phenomena using appropriate tools and models.</u>	
(B)	<u>Engineering practices. Students should be able to identify problems and design solutions using appropriate tools and models.</u>	

Science TEKS Review Work Group B Final Recommendations

(5)(4)	<p>Science and social ethics. Scientific decision making is a way of answering questions about the natural world. <u>Social justice applies the concept of social responsibility to determine if something is ethical.</u> Students should be able to distinguish between scientific decision-making methods (<u>scientific and engineering practices</u>) and <u>the use of ethics</u> ethica and social <u>justice to make</u> decisions that involve the application of scientific information <u>and engineering design.</u></p>	<p>Better defined social ethics. Modernized language by incorporating engineering</p>
(6)(5)	<p>Scientific <u>cross-cutting concepts.</u> <u>Science is a series of cross cutting concepts such as systems, models, and patterns.</u> A system is a collection of cycles, structures, and processes that interact. All systems have basic properties that can be described in space, time, energy, and matter. Change and constancy occur in systems as patterns and can be observed, measured, and modeled. These patterns help to make predictions that can be scientifically tested <u>while models allow for boundary specification and a tool for understanding the ideas presented.</u> Students should analyze a system in terms of its components and how these components relate to each other, to the whole, and to the external environment.</p>	<p>To clarify language around systems, define the cross-cutting concepts, and include additional specificity regarding scalability of models.</p>
(7)(6)	<p>Statements containing the word "including" reference content that must be mastered, while those containing the phrase "such as" are intended as possible illustrative examples.</p>	
(c)	<p>Knowledge and skills.</p>	
(1)	<p>Scientific processes. The student, for at least 40% of instructional time, conducts laboratory and field investigations using safe, environmentally appropriate, and ethical practices. The student is expected to:</p>	<p>A separate Scientific and Engineering Practices Work Group developed recommendations for revisions to the current process skills for K-12. Recommendations from the Scientific and Engineering Practices Work Group for proposed new (1)–(4) are posted on the Science TEKS Review Drafts web page.</p>
(A)	<p>demonstrate safe practices during laboratory and field investigations, including the appropriate use of safety showers, eyewash fountains, safety goggles or chemical splash goggles, as appropriate, and fire extinguishers;</p>	
(B)	<p>know specific hazards of chemical substances such as flammability, corrosiveness, and radioactivity as summarized on the Safety Data Sheets (SDS); and</p>	
(C)	<p>demonstrate an understanding of the use and conservation of resources and the proper disposal or recycling of materials.</p>	
(2)	<p>Scientific processes. The student uses scientific practices to solve investigative questions. The student is expected to:</p>	
(A)	<p>know the definition of science and understand that it has limitations, as specified in subsection (b)(2) of this section;</p>	

Science TEKS Review Work Group B Final Recommendations

(B)	know that scientific hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions are incorporated into theories;	
(C)	know that scientific theories are based on natural and physical phenomena and are capable of being tested by multiple independent researchers. Unlike hypotheses, scientific theories are well established and highly reliable explanations, but may be subject to change as new areas of science and new technologies are developed;	
(D)	distinguish between scientific hypotheses and scientific theories;	
(E)	plan and implement investigative procedures, including asking questions, formulating testable hypotheses, and selecting equipment and technology, including graphing calculators, computers and probes, electronic balances, an adequate supply of consumable chemicals, and sufficient scientific glassware such as beakers, Erlenmeyer flasks, pipettes, graduated cylinders, volumetric flasks, and burettes;	
(F)	collect data and make measurements with accuracy and precision;	
(G)	express and manipulate chemical quantities using scientific conventions and mathematical procedures, including dimensional analysis, scientific notation, and significant figures;	
(H)	organize, analyze, evaluate, make inferences, and predict trends from data; and	
(I)	communicate valid conclusions supported by the data through methods such as lab reports, labeled drawings, graphs, journals, summaries, oral reports, and technology-based reports.	
(3)	Scientific processes. The student uses critical thinking, scientific reasoning, and problem solving to make informed decisions within and outside the classroom. The student is expected to:	
(A)	analyze, evaluate, and critique scientific explanations by using empirical evidence, logical reasoning, and experimental and observational testing, so as to encourage critical thinking by the student;	
(B)	communicate and apply scientific information extracted from various sources such as current events, published journal articles, and marketing materials;	
(C)	draw inferences based on data related to promotional materials for products and services;	
(D)	evaluate the impact of research on scientific thought, society, and the environment;	
(E)	describe the connection between chemistry and future careers; and	
(F)	describe the history of chemistry and contributions of scientists.	

Science TEKS Review Work Group B Final Recommendations

(4)	Science concepts. The student knows the characteristics of matter and can analyze the relationships between chemical and physical changes and properties. The student is expected to:	<p>Recommend deletion based on survey responses and framework; physical changes and properties covered in K-5; grade 6 (6)(A) physical properties, (6)(C) density; grade 8 (5)(A) atom structure, (5)(B) chemical properties; IPC (6)(A) physical properties, (6)(B) physical properties, (6)(C) analyze properties; rather deepen knowledge around bonding and intermolecular forces. IPC and Chemistry are in agreement that these properties should be mastered by the end of middle school.</p> <p>Not necessarily terminal standards; work group explained that physical and chemical properties were addressed in conjunction with other concepts and did not need to be explicitly called out in a separate KS, such as in (4)(A) and new (6)(D) of their revisions.</p>
(A)	differentiate between physical and chemical changes and properties;	
(B)	identify extensive properties such as mass and volume and intensive properties such as density and melting point;	
(C)	compare solids, liquids, and gases in terms of compressibility, structure, shape, and volume; and	
(D)	classify matter as pure substances or mixtures through investigation of their properties.	
(4) (5)	Science concepts. The student understands the historical development of the Periodic Table and <u>applies</u> can apply its predictive power. The student is expected to:	The development of the Periodic Table is dynamic and ongoing.
(A)	<u>construct explanations to communicate</u> explain the use of chemical and physical properties in the historical development of the Periodic Table <u>over time using evidence such as</u> explain the use of <u>chemical and physical properties</u> ;	“construct explanations to communicate” addresses science practices and is more rigorous; “historical” to “over time” connects to revised KS
(B)	<u>predict the properties of elements in</u> identify and explain the properties of chemical families, including alkali metals, alkaline earth metals, halogens, noble gases, and transition metals, <u>based on the patterns of valence electrons</u> using the Periodic Table; and	Patterns are part of cross-cutting concepts; “predict” elevates rigor and connects more directly to the KS

Science TEKS Review Work Group B Final Recommendations

(C)	<u>analyze and</u> interpret <u>elemental data</u> periodic trends , including atomic radius, <u>atomic mass</u> , electronegativity, and ionization energy, <u>and reactivity to discover trends in</u> using the Periodic Table.	MV: not all agreed on inclusion of atomic mass "Reactivity" pulled from grade 8 (5)(B)
(5) (6)	Science concepts. The student knows and understands the historical development of atomic theory <u>and applies it to real-world phenomena</u>. The student is expected to:	KS as written did not fully encompass SEs
(A)	<u>construct models using</u> describe the experimental design and conclusions used in the development of modern atomic theory, including Dalton's Postulates, Thomson's discovery of electron properties, Rutherford's nuclear atom, and Bohr's nuclear atom, <u>and Heisenberg's Uncertainty Principle to show the development of modern atomic theory over time;</u>	Fits with cross-cutting; more measurable student outcome; pulls in quantum concepts (modern); new verb integrates science and engineering practices
(B)	<u>describe the structure of atoms and ions, including the masses, electrical charges, and locations of protons and neutrons in the nucleus and electrons in the electron cloud;</u>	Atomic theory is part of the HS framework; pulled from grade 8, (5)(A) and added ions; recommend that grade 8 delete (5)(A) and (B) MV: lacks science and engineering practices; cross-cutting concepts
(C) (B)	<u>investigate the quantized energy emitted by electron movement of various elements and relate the emissions to</u> describe the mathematical relationships between energy, frequency, and wavelength of light using the electromagnetic spectrum;	
(D) (C)	calculate average atomic mass of an element using isotopic composition; and	
(E) (D)	<u>construct models to</u> express the arrangement of electrons in atoms of representative elements using electron configurations and Lewis valence electron dot structures.	MV: not all agreed on addition Important to address in PD-- developing and using models is part of doing science; distinguish between scientific and engineering models
(6) (7)	Science concepts. The student knows how atoms form ionic, covalent, and metallic bonds. The student is expected to:	
(A)	<u>construct an argument to support how</u> periodic trends such as electronegativity can predict <u>bonding between elements;</u>	Connects ideas of this KS to KS(5) via periodic trends

Science TEKS Review Work Group B Final Recommendations

(B) (A)	name <u>and write the chemical formulas for</u> ionic <u>and covalent</u> compounds containing main group or transition metals, covalent compounds, acids, and bases using International Union of Pure and Applied Chemistry (IUPAC) nomenclature rules;	Not in framework; however in CCRS: “know formulas for ionic compounds and molecular compounds”; students need comfort with encountering scientific terms in real world applications; acids moved to new KS (12)
(B)	write the chemical formulas of ionic compounds containing representative elements, transition metals and common polyatomic ions, covalent compounds, and acids and bases;	Combined with (B)
(C)	construct electron dot formulas to illustrate ionic and covalent bonds;	Combined into new (C)
(D)	describe metallic bonding and explain metallic properties such as thermal and electrical conductivity, malleability, and ductility; and	Combined into new (D)
(C) (E)	classify <u>and draw electron dot molecular</u> structures for molecules with linear, <u>bent</u> , trigonal planar, <u>trigonal pyramidal</u> , and tetrahedral <u>electron pair molecular</u> geometries as explained by Valence Shell Electron Pair Repulsion (VSEPR) theory; <u>and</u>	Lacked application; now addresses molecular geometries and intermolecular forces; clearer for first-year teachers
(D)	<u>analyze the properties of ionic, covalent, and metallic substances in terms of intramolecular forces and intermolecular forces.</u>	Delves deeper into the intramolecular forces and intermolecular forces which are both referenced in CCRS and framework; teachers requested IMF to be added in
(7) (8)	Science concepts. The student <u>understands how matter is accounted for in</u> can quantify the changes that occur during chemical <u>substances reactions</u>. The student is expected to:	Better alignment to student expectations now that the KS has been split.
(A)	define and use the concept of a mole <u>and apply the concept of molar mass to convert between moles and grams</u> ;	Work group wanted to add application level to the concept of the mole
(B)	calculate the number of atoms or molecules in a sample of material using Avogadro's number;	
(C)	calculate percent composition of compounds; <u>and</u>	
(D)	differentiate between empirical and molecular formulas; ;	Survey: some teachers wanted calculation empirical and molecular to be added; work group felt it was unnecessary
(8)	<u>Science concepts. The student understands how matter is accounted for in chemical reactions. The student is expected to:</u>	Split from previous KS; provides better context for new teachers.
(A) (E)	write and balance chemical equations using the law of conservation of mass;	

Science TEKS Review Work Group B Final Recommendations

(B) (F)	differentiate among double replacement reactions, including acid-base reactions and precipitation reactions, and oxidation-reduction reactions such as synthesis, decomposition, single replacement, and combustion reactions;	
(C) (G)	perform stoichiometric calculations, including determination of mass <u>relationships</u> , and gas volume relationships between reactants and products , and percent yield; and	Provides clarity in expectation, will assist new teachers in understanding expectation Survey: work group felt that on-level should be able to “perform calculations” and should not simply be conceptual
(D) (H)	describe the concept of limiting reactants in a balanced chemical equation.	
(9)	Science concepts. The student understands the principles of <u>the kinetic molecular theory</u> and; ideal gas behavior kinetic molecular theory, and the conditions that influence the behavior of <u>gases</u>. The student is expected to:	There is a difference between real and ideal gasses. All the SEs are about ideal gas law and gasses.
(A) (B)	describe the postulates of <u>the</u> kinetic molecular theory;	
(B) (A)	describe and calculate the <u>relationships</u> between volume, pressure, number of moles, and temperature for an ideal gas as described by Boyle's law, Charles' law, Avogadro's law, Dalton's law of partial pressure, and the ideal gas law ; and	Not all laws are included and are implied by stating the relationships between volume, pressure, number of moles, and temperature
(C)	<u>define and apply Dalton's law of partial pressure.</u>	This law is just about pressure; not appropriately grouped into previous SE
(10)	Science concepts. The student understands and can apply the factors that influence the behavior of solutions. The student is expected to:	
(A)	describe the unique role of water in solutions in terms of polarity;	Recommend that middle school address properties of water to address conceptual gap
(B)	<u>distinguish among types of solutions such as electrolytes and nonelectrolytes; and unsaturated, saturated, and supersaturated solutions; and strong and weak acids and bases;</u>	Acids and bases moved to new (11)(C) with other SEs related to that topic Work group felt this was a better arrangement of standards for knowledge progression.

Science TEKS Review Work Group B Final Recommendations

(C)	<i>investigate factors that influence solid and gas solubilities such as temperature using solubility curves and rates of dissolution such as temperature, agitation, and surface area;</i>	Work group felt this was a better arrangement of standards for knowledge progression Additional detail of solubility curves is helpful for new teachers; curves help contextualize the topic of solid and gas solubilities
(D)	<i>investigate apply the general rules regarding solubility through investigations and with aqueous solutions <u>predict the products of a double replacement reaction;</u></i>	Work group felt adding prediction gave additional meaning to knowledge of solubility rules
(E) (G)	calculate the concentration of solutions in units of molarity; <u>and</u>	
(F) (H)	calculate the dilutions of solutions using molarity.;	
(E)	<i>distinguish among types of solutions such as electrolytes and nonelectrolytes; unsaturated, saturated, and supersaturated solutions; and strong and weak acids and bases;</i>	New (10)(B)
(F)	<i>investigate factors that influence solid and gas solubilities and rates of dissolution such as temperature, agitation, and surface area;</i>	New (10)(C)
(11)	<u>Science concepts. The student understands and applies various rules regarding acids and bases. The student is expected to:</u>	Work group felt the split out from solutions allowed them to add greater specificity to acid-base SEs. Survey: add titrations to acids and bases and red-ox; work group felt it might be outside scope of course; some schools may lack equipment
(A)	<i>name and write the chemical formulas for acids using IUPAC nomenclature rules;</i>	Naming of acids moved from KS (7)
(B) (G)	define acids and bases and distinguish between Arrhenius and Bronsted-Lowry definitions and predict products in acid-base reactions that form water; and	
(C)	<i>differentiate between strong and weak acids and bases;</i>	
(D)	<i>predict products in acid-base reactions that form water;</i> <u>and</u>	
(E) (H)	define pH and calculate the pH of a solution using the hydrogen ion concentration.	

Science TEKS Review Work Group B Final Recommendations

(12) (H)	Science concepts. The student understands the energy changes that occur in chemical reactions. The student is expected to:	
(A)	describe energy and its forms, including kinetic, potential, chemical, and thermal energies;	Energy and its forms have been substantially covered in previous grade-level content: Grade 3 mechanical, light, sound, and thermal, Grade 5, (6)(A) thermal and sound; Grade 6 (8)(A) kinetic and potential; Grade 7 (7)(A) chemical energy in photosynthesis
(A) (B)	<u>describe and explain everyday examples that illustrate the four laws of thermodynamics;</u>	Moved from Physics (6)(E); addresses entropy per survey
(B)	<u>investigate</u> describe the law of conservation of energy and the processes of heat transfer in terms of calorimetry;	
(C)	<u>differentiate processes</u> classify reactions as exothermic or endothermic and represent energy changes that occur in chemical reactions using thermochemical equations or graphical analysis; and	Not all exothermic or endothermic examples are reactions; some are physical processes; change is more encompassing Survey: calculate enthalpy; Work group felt that this might be beyond scope of course and that teachers may add if time allows
(D)	perform calculations involving heat, mass, temperature change, and specific heat.	
(13) (H)	Science concepts. The student understands the basic processes of nuclear chemistry. The student is expected to:	Survey: get rid of this altogether; add practical uses of nuclear chem; when it applies/real-world application Bringing over the SE from Physics addresses the application piece that survey respondents referred to.
(A)	describe the characteristics of alpha, beta, and gamma radioactive decay processes in terms of balanced nuclear equations; <i>and</i>	
(B)	compare fission and fusion reactions; <i>and</i>	

Science TEKS Review Work Group B Final Recommendations

(C)	<u>give examples of applications of nuclear phenomena such as nuclear stability, radiation therapy, diagnostic imaging, solar cells, and nuclear power.</u>	Brought SE over from Physics (8)(D) and eliminated references to “atomic” and “quantum phenomena” as well as the “standard model” to help limit the burden of additional mathematics. Also, this Chemistry KS is limited to nuclear where Physics included both atomic and quantum.
-----	---	--

DRAFT

Science TEKS Review Work Group B Final Recommendations

§112.38. Integrated Physics and Chemistry (One Credit), Adopted 2017.		
	TEKS with edits	Work Group Comments
(a)	General requirements. Students shall be awarded one credit for successful completion of this course. Prerequisites: none. This course is recommended for students in Grade 9 or 10.	
(b)	Introduction.	
(1)	Integrated Physics and Chemistry. <u>By the end of 12th grade, students are expected to gain sufficient knowledge of the scientific and engineering practices across the disciplines of science to make informed decisions using critical thinking and scientific problem solving.</u> In Integrated Physics and Chemistry, students conduct laboratory and field investigations, use scientific practices during investigation, and make informed decisions using critical thinking and scientific problem solving. This course integrates the disciplines of physics and chemistry in the following topics: force, motion, energy, and matter.	This language is the same across courses. The purpose is to capture the goals of learning science based on the K12 Framework and combine it with what the TEKS already has.
(2)	Nature of science. <u>According to the National Science Teaching Association (NSTA), the “nature of science is a critical component of scientific literacy that enhances students’ understandings of science concepts and enables them to make informed decisions about scientifically-based personal and societal issues.”</u> Science, as defined by the National Academy of Sciences, is the “use of evidence to construct testable explanations and predictions of natural phenomena, as well as the knowledge generated through this process.” This vast body of changing and increasing knowledge is described by physical, mathematical, and conceptual models. Students should know that some questions are outside the realm of science because they deal with phenomena that are not currently scientifically testable by empirical science.	Used a quotation for nature of science as opposed to a definition of science. The new definition emphasizes literacy.
(3)	<u>Scientific hypotheses and theories. Students are expected to know that:</u>	Added SEs 2.B and 2.C as recommended by the scientific and engineering practices work group. Deleted 2.A. because the content was already addressed above in 2. Definitions help teachers have a shared understanding of these terms.
(A)	<u>hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions are incorporated into theories; and</u>	

Science TEKS Review Work Group B Final Recommendations

(B)	<u>scientific theories are based on natural and physical phenomena and are capable of being tested by multiple independent researchers. Unlike hypotheses, scientific theories are well established and highly reliable explanations, but they may be subject to change as new areas of science and new technologies are developed.</u>	
(4) (3)	Scientific inquiry. Scientific inquiry is the planned and deliberate investigation of the natural world <u>using scientific and engineering practices</u> . Scientific methods of investigation are experimental , descriptive, or comparative, <u>or experimental</u> . The method chosen should be appropriate to the question being asked. <u>Student learning for different types of investigations is as follows: descriptive investigations involve collecting data and recording observations without making comparisons; comparative investigations involve collecting data with variables that are manipulated to compare results; and experimental investigations involve processes similar to comparative investigations, but a control is identified.</u>	Changed order for consistency and intentional ordering of “hierarchy” or types of investigations. Defined types of investigations and scientific and engineering practices as recommended by Work Group A.
(A)	<u>Scientific practices. Students should be able to ask questions, plan and conduct investigations to answer questions, and explain phenomena using appropriate tools and models.</u>	
(B)	<u>Engineering practices. Students should be able to identify problems and design solutions using appropriate tools and models.</u>	
(5) (4)	Science and social ethics. Scientific decision making is a way of answering questions about the natural world. <u>Social justice applies the concept of social responsibility to determine if something is ethical</u> . Students should be able to distinguish between scientific decision-making methods (scientific <u>and engineering</u> practices) and <u>the use of ethics ethical</u> and social <u>justice to make</u> decisions that involve science (the application of scientific information) <u>and engineering design</u> .	Better defined social ethics. Modernized language by incorporating engineering
(6) (5)	<u>Scientific cross-cutting concepts. Science is a series of cross cutting concepts such as Science systems, models, and patterns. A system is a collection of cycles, structures, and processes that interact</u> . All systems have basic properties that can be described in space, time, energy, and matter. Change and constancy occur in systems as patterns and can be observed, measured, and modeled. These patterns help to make predictions that can be scientifically tested, <u>while models allow for boundary specification and a tool for understanding the ideas presented</u> . Students should analyze a system in terms of its components and how these components relate to each other, to the whole, and to the external environment.	To clarify language around systems, define the cross-cutting concepts, and include additional specificity regarding scalability of models.
(7) (6)	Statements containing the word "including" reference content that must be mastered, while those containing the phrase "such as" are intended as possible illustrative examples.	

Science TEKS Review Work Group B Final Recommendations

(c)	Knowledge and skills.	
(+)	Scientific processes. The student, for at least 40% of instructional time, conducts laboratory and field investigations using safe, environmentally appropriate, and ethical practices. The student is expected to:	A separate Scientific and Engineering Practices Work Group developed recommendations for revisions to the current process skills for K-12. Recommendations from the Scientific and Engineering Practices Work Group for proposed new (1)-(4) are posted on the Science TEKS Review Drafts web page .
(A)	demonstrate safe practices during laboratory and field investigations, including the appropriate use of safety showers, eyewash fountains, safety goggles or chemical splash goggles, as appropriate, and fire extinguishers;	
(B)	know specific hazards of chemical substances such as flammability, corrosiveness, and radioactivity as summarized on the Safety Data Sheets (SDS); and	
(C)	demonstrate an understanding of the use and conservation of resources and the proper disposal or recycling of materials.	
(2)	Scientific processes. The student uses scientific practices during laboratory and field investigations. The student is expected to:	
(A)	know the definition of science and understand that it has limitations, as specified in subsection (b)(2) of this section;	
(B)	plan and implement investigative procedures, including asking questions, formulating testable hypotheses, and selecting equipment and technology;	
(C)	collect data and make measurements with accuracy and precision;	
(D)	organize, analyze, evaluate, make inferences, and predict trends from data; and	
(E)	communicate valid conclusions supported by the data through methods such as lab reports, labeled drawings, graphs, journals, summaries, oral reports, and technology-based reports.	
(3)	Scientific processes. The student uses critical thinking, scientific reasoning, and problem solving to make informed decisions. The student is expected to:	
(A)	analyze, evaluate, and critique scientific explanations by using empirical evidence, logical reasoning, and experimental and observational testing, so as to encourage critical thinking by the student;	
(B)	communicate and apply scientific information extracted from various sources such as current events, published journal articles, and marketing materials;	

Science TEKS Review Work Group B Final Recommendations

(C)	draw inferences based on data related to promotional materials for products and services;	
(D)	evaluate the impact of research on scientific thought, society, and the environment;	
(E)	describe connections between physics and chemistry and future careers; and	
(F)	research and describe the history of physics and chemistry and contributions of scientists.	
(4)	Science concepts. The student knows <u>the relationship between concepts of force and motion evident</u> in everyday life. The student is expected to:	
(A)	<u>investigate, analyze, and model motion</u> describe and calculate an object's motion in terms of position, <u>velocity, acceleration, and time using tables, graphs, and mathematical relationships</u> displacement, speed, and acceleration;	Reorganization and changing the rigor to better bridge what is expected in Physics 4A and 4B versus what is traditionally taught in SE 6.8.C, 6.8.D, 8.6.A, and 8.6B. Increased specificity.
(B)	measure and graph distance and speed as a function of time;	Now is included in 4A.
(C)	investigate how an object's motion changes only when a net force is applied, including activities and equipment such as toy cars, vehicle restraints, sports activities, and classroom objects;	The current student expectation should be mastered in Grades 6-8 in 6.8B and 8.6A.
(B) (D)	<u>analyze data to explain the relationship between mass and acceleration in terms of the net force on an object, in one dimension, using free-body/force diagrams, tables, and graphs;</u> describe and calculate the relationship between force, mass, and acceleration using equipment such as dynamic carts, moving toys, vehicles, and falling objects;	Reorganization and changing the rigor to better bridge what is expected in Physics 4D versus what is traditionally taught in eighth grade 8.6C. Increased specificity.
(C) (E)	<u>apply the concepts of momentum and impulse to design, evaluate, and refine a device to minimize the net force on objects during collisions such as those that occur during vehicular accidents, sports activities, or the dropping of personal electronic devices; and</u> explain the concept of conservation of momentum; using action and reaction forces;	Remove conservation of momentum because this the first introduction of momentum so the focus will be on impulse and momentum as it relates to forces. Design, evaluate and refine were chosen to integrate engineering practices.
(D) (F)	<u>construct and communicate an explanation based on evidence for how changes in mass, charge, and distance affect the strength of gravitational and electrical forces between two objects.</u> describe the gravitational attraction between objects of different masses at different distances; and	Combined 4F and 4G into one SE because gravitational forces and electrical forces behave similarly. This could be a conceptual explanation of the relationship.
(G)	examine electrical force as a universal force between any two charged objects.	Combined 4F and 4G into one SE because gravitational forces and electrical forces behave similarly.

Science TEKS Review Work Group B Final Recommendations

(5)	Science concepts. The student recognizes multiple forms of energy and knows the impact of energy transfer and energy conservation in everyday life. The student is expected to:	
(A)	recognize and demonstrate that objects and substances in motion have kinetic energy such as vibration of atoms, water flowing down a stream moving pebbles, and bowling balls knocking down pins;	The current student expectation should be mastered in Grades 6-8 in SE 6.8A.
(B)	recognize and demonstrate common forms of potential energy, including gravitational, elastic, and chemical, such as a ball on an inclined plane, springs, and batteries;	The current student expectation should be mastered in Grades 6-8 in SE 6.8A.
(B) (C)	<u>design, evaluate, and refine a device that generates electrical energy through the interaction of electric charges and magnetic fields such as a generator, windmill, or other mechanically powered device;</u> demonstrate that moving electric charges produce magnetic forces and moving magnets produce electric forces;	Design, evaluate, and refine were chosen to integrate engineering practices. Wording was changed to add specificity and rigor, and to link how electrical and magnetic fields are used in society.
(C) (D)	<u>plan and conduct an investigation to provide evidence that energy is conserved within a closed system;</u> investigate the law of conservation of energy;	Added specificity and rigor and emphasized systems thinking approach. Added the verb plan to indicate students should be planning their own investigation.
(D) (E)	investigate and demonstrate the movement of thermal energy through solids, liquids, and gases by convection, conduction, and radiation such as in weather, living, and mechanical systems;	The current student expectation should be mastered in Grades 6-8 in SE 6.9A.
(A) (F)	<u>design and construct series and parallel circuits that model real world circuits such as in home wiring, automobile wiring, and simple electrical devices to</u> evaluate the transfer of electrical energy in series and parallel circuits and conductive materials;	Changed the wording to provide more specificity and the verb to allow for more real-world relevance.
(E)	<u>plan and conduct an investigation to evaluate the transfer of energy or information through different materials by different types of waves such as wireless signals, ultraviolet radiation, and microwaves;</u>	Helps relate waves to technology and real-life applications.
(F) (G)	<u>construct and communicate an explanation based on evidence for how wave interference, reflection, and refraction are used in technology such as medicine, communication, and scientific research; and explore the characteristics and behaviors of energy transferred by waves, including acoustic, seismic, light, and waves on water, as they reflect, refract, diffract, interfere with one another, and are absorbed by materials;</u>	Allows a connection of wave properties to technology.
(H)	analyze energy transformations of renewable and nonrenewable resources; and	Moved to combine with 5(I).

Science TEKS Review Work Group B Final Recommendations

(G) (+)	<u>evaluate evidence from multiple sources to</u> critique the advantages and disadvantages of various <u>renewable and nonrenewable</u> energy sources and their impact on society and the environment.	Changed the verb to align with science and engineering practices. Combined with 5(H) for streamlining.
(6)	Science concepts. The student knows that relationships exist between the structure and properties of matter. The student is expected to:	
(A)	<u>relate an element's atomic structure to its bonding, reactivity, and placement on the Periodic Table;</u> examine differences in physical properties of solids, liquids, and gases as explained by the arrangement and motion of atoms or molecules;	The deleted concepts are developmentally appropriate for middle school and should be moved to and mastered in Grades 6-8 such as in SE 7.6. IPC and Chemistry work group B members are in agreement that these properties should be mastered by the end of middle school.
(B)	<u>use patterns within the Periodic Table to predict the relative physical and chemical properties of elements;</u> relate chemical properties of substances to the arrangement of their atoms;	Added to place an emphasis of the predictive capability of the Periodic Table.
(C)	<u>explain how analyze</u> physical and chemical properties of <u>substances are related to their usage in everyday life such as in sunscreen, cookware, industrial applications, and fuels; and elements and compounds such as color, density, viscosity, buoyancy, boiling point, freezing point, conductivity, and reactivity;</u>	Changed the SE to emphasize the connection between properties and usage of substances and increase connections to everyday life.
(D)	relate the placement of an element on the Periodic Table to its physical and chemical behavior, including bonding and classification;	Re-wrote to emphasize the arrangement of electrons and the relationship to properties.
(E)	relate the structure of water to its function as a solvent; and	Eliminated – this concept is beyond the scope of IPC. It is covered in the proposed TEKS for Chemistry 10A.
(D) (+)	<u>plan and conduct an investigation to provide evidence that the rate of reaction or dissolving is affected by multiple factors such as particle size, stirring, temperature, and concentration.</u> investigate the properties of water solutions and factors affecting solid solubility, including nature of solute, temperature, and concentration.	Consolidated reaction rate with solutions. Students should be planning the investigations.
(7)	Science concepts. The student knows that changes in matter affect everyday life. The student is expected to:	
(A)	investigate <u>how changes in properties are indicative of chemical reactions such as hydrochloric acid with a metal, oxidation of metal, combustion, and neutralizing an acid with an antacid;</u> changes of state as it relates to the arrangement of particles of matter and energy transfer;	The deleted concepts are developmentally appropriate for middle school and should be moved to and mastered in Grades 6-8. Reactions provided to increase specificity and application to everyday life.

Science TEKS Review Work Group B Final Recommendations

(B)	recognize that chemical changes can occur when substances react to form different substances and that these interactions are largely determined by the valence electrons;	The concepts are embedded within 6(A) & 7(A).
(B) (E)	<u>develop and use models to balance chemical equations and support the claim that atoms, and therefore mass, are conserved during a chemical reaction;</u> demonstrate that mass is conserved when substances undergo chemical change and that the number and kind of atoms are the same in the reactants and products;	The deleted concepts are developmentally appropriate for middle school and should be mastered in Grades 6-8 in SE 8.5E. The new standard builds on middle school concepts and adds complexity and rigor. Bridges the gap between middle school and chemistry.
(D)	classify energy changes that accompany chemical reactions such as those occurring in heat packs, cold packs, and glow sticks as exothermic or endothermic reactions;	Combined concepts with 7(A).
(C) (E)	<u>research and communicate the uses, advantages, and disadvantages of nuclear reactions in current technologies; and</u> describe types of nuclear reactions such as fission and fusion and their roles in applications such as medicine and energy production; and	Added rigor and made the content more applicable to student lives and future developments in technology.
(D) (E)	<u>construct and communicate an explanation based on evidence for</u> research and describe the environmental and economic impact of the end-products of chemical reactions such as those that may result in acid rain , degradation of water, <u>soil</u> , and air quality. and ozone depletion.	Changed the verb to better align with the new science and engineering practices, removed economic impact as it is beyond the level of IPC students in terms of their understanding of economies. Removed acid rain and ozone depletion and added soil degradation to allow teachers to focus on local issues in addition to more global issues that may arise.

Science TEKS Review Work Group B Final Recommendations

§112.39. Physics (One Credit), Adopted 2017.		
TEKS with edits		Work Group Comments
(a)	<p>General requirements. Students shall be awarded one credit for successful completion of this course. Algebra I is suggested as a prerequisite or corequisite. This course is recommended for students in Grade 9, 10, 11, or 12.</p>	
(b)	<p>Introduction.</p>	
(1)	<p>Physics. <u>By the end of 12th grade, students are expected to gain sufficient knowledge of the scientific and engineering practices across the disciplines of science to make informed decisions using critical thinking and scientific problem solving.</u> In Physics, students conduct laboratory and field investigations, use scientific practices during investigations, and make informed decisions using critical thinking and scientific problem solving. Students study a variety of topics that include: laws of motion; changes within physical systems and conservation of energy and momentum; forces; thermodynamics; characteristics and behavior of waves; <u>and electricity and magnetism.</u> and atomic, nuclear, and quantum physics. Students who successfully complete Physics <u>will be able to acquire factual knowledge within a</u> apply <u>conceptual knowledge and collaborative skills framework, practice</u> to experimental design, <u>implementation,</u> and interpretation. work collaboratively with colleagues, and develop critical thinking skills.</p>	<p>Group suggested deleting topics of thermodynamics, and atomic, nuclear, and quantum physics, from the introduction because of suggested changes to student expectations.</p> <p>Changes to the last sentences were made to avoid redundancy, and emphasize application of basic principles rather than memorization of facts.</p>
(2)	<p>Nature of science. <u>According to the National Science Teaching Association (NSTA), the “nature of science is a critical component of scientific literacy that enhances students’ understandings of science concepts and enables them to make informed decisions about scientifically-based personal and societal issues.”</u> Science, as defined by the National Academy of Sciences, is the “use of evidence to construct testable explanations and predictions of natural phenomena, as well as the knowledge generated through this process.” This vast body of changing and increasing knowledge is described by physical, mathematical, and conceptual models. Students should know that some questions are outside the realm of science because they deal with phenomena that are not currently scientifically testable by empirical science.</p>	<p>Used a quotation for nature of science as opposed to a definition of science. The new definition emphasizes literacy.</p>

Science TEKS Review Work Group B Final Recommendations

(3)	<p><u>Scientific hypotheses and theories. Students are expected to know that:</u></p>	<p>Added SEs 2.B and 2.C as recommended by the scientific and engineering practices work group. Deleted 2.A. because the content was already addressed above in 2.</p> <p>Definitions help teachers have a shared understanding of these terms.</p>
(A)	<p><u>hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence. Hypotheses of durable explanatory power that have been tested over a wide variety of conditions are incorporated into theories; and</u></p>

(4) (3)	<p>Scientific inquiry. Scientific inquiry is the planned and deliberate investigation of the natural world <u>using scientific and engineering practices</u>. Scientific methods of investigation are can be experimental, descriptive, or comparative, <u>or experimental</u>. The method chosen should be appropriate to the question being asked. <u>Student learning for different types of investigations is as follows: descriptive investigations involve collecting data and recording observations without making comparisons; comparative investigations involve collecting data with variables that are manipulated to compare results; experimental investigations involve processes similar to comparative investigations, but a control is identified.</u></p>	<p>Changed order for consistency and intentional ordering of “hierarchy” or types of investigations.</p> <p>Defined types of investigations and scientific and engineering practices as recommended by Work Group A.</p>
(A)	<p><u>Scientific practices. Students should be able to ask questions, plan and conduct investigations to answer questions, and explain phenomena using appropriate tools and models.</u></p>	

Science TEKS Review Work Group B Final Recommendations

(B)	<u>Engineering practices. Students should be able to identify problems and design solutions using appropriate tools and models.</u>	
(5) (4)	Science and social ethics. Scientific decision making is a way of answering questions about the natural world. <u>Social justice applies the concept of social responsibility to determine if something is ethical.</u> Students should be able to distinguish between scientific decision-making methods (<u>scientific and engineering practices</u>) and <u>the use of ethics ethical</u> and social <u>justice to make</u> decisions that involve the application of scientific information <u>and engineering design</u> .	Better defined social ethics. Modernized language by incorporating engineering
(6) (5)	Scientific <u>cross-cutting concepts. Science is a series of cross cutting concepts such as systems, models and patterns. A system is a collection of cycles, structures, and processes that interact.</u> All systems have basic properties that can be described in space, time, energy, and matter. Change and constancy occur in systems as patterns and can be observed, measured, and modeled. These patterns help to make predictions that can be scientifically tested <u>while models allow for boundary specification and a tool for understanding the ideas presented.</u> Students should analyze a system in terms of its components and how these components relate to each other, to the whole, and to the external environment.	To clarify language around systems, define the cross-cutting concepts, and include additional specificity regarding scalability of models.
(7) (6)	Statements containing the word "including" reference content that must be mastered, while those containing the phrase "such as" are intended as possible illustrative examples.	
(c)	Knowledge and skills.	
(1)	Scientific processes. The student conducts investigations, for at least 40% of instructional time, using safe, environmentally appropriate, and ethical practices. These investigations must involve actively obtaining and analyzing data with physical equipment but may also involve experimentation in a simulated environment as well as field observations that extend beyond the classroom. The student is expected to:	A separate Scientific and Engineering Practices work group developed recommendations for revisions to the current process skills for K-12. Recommendations from the scientific and engineering practices work group are posted on the Science TEKS Review Drafts web page .
(A)	demonstrate safe practices during laboratory and field investigations; and	
(B)	demonstrate an understanding of the use and conservation of resources and the proper disposal or recycling of materials.	
(2)	Scientific processes. The student uses a systematic approach to answer scientific laboratory and field investigative questions. The student is expected to:	

Science TEKS Review Work Group B Final Recommendations

(A)	know the definition of science and understand that it has limitations, as specified in subsection (b)(2) of this section;	
(B)	know that scientific hypotheses are tentative and testable statements that must be capable of being supported or not supported by observational evidence;	
(C)	know that scientific theories are based on natural and physical phenomena and are capable of being tested by multiple independent researchers. Unlike hypotheses, scientific theories are well established and highly reliable explanations, but may be subject to change;	
(D)	design and implement investigative procedures, including making observations, asking well defined questions, formulating testable hypotheses, identifying variables, selecting appropriate equipment and technology, evaluating numerical answers for reasonableness, and identifying causes and effects of uncertainties in measured data;	
(E)	demonstrate the use of course apparatus, equipment, techniques, and procedures, including multimeters (current, voltage, resistance), balances, batteries, dynamics demonstration equipment, collision apparatus, lab masses, magnets, plane mirrors, convex lenses, stopwatches, trajectory apparatus, graph paper, magnetic compasses, protractors, metric rulers, spring scales, thermometers, slinky springs, and/or other equipment and materials that will produce the same results;	
(F)	use a wide variety of additional course apparatus, equipment, techniques, materials, and procedures as appropriate such as ripple tank with wave generator, wave motion rope, tuning forks, hand held visual spectrosopes, discharge tubes with power supply (H, He, Ne, Ar), electromagnetic spectrum charts, laser pointers, micrometer, caliper, computer, data acquisition probes, scientific calculators, graphing technology, electrostatic kits, electroscope, inclined plane, optics bench, optics kit, polarized film, prisms, pulley with table clamp, motion detectors, photogates, friction blocks, ballistic carts or equivalent, resonance tube, stroboscope, resistors, copper wire, switches, iron filings, and/or other equipment and materials that will produce the same results;	
(G)	make measurements with accuracy and precision and record data using scientific notation and International System (SI) units;	
(H)	organize, evaluate, and make inferences from data, including the use of tables, charts, and graphs;	
(I)	communicate valid conclusions supported by the data through various methods such as lab reports, labeled drawings, graphic organizers, journals, summaries, oral reports, and technology based reports; and	

Science TEKS Review Work Group B Final Recommendations

(1)	express relationships among physical variables quantitatively, including the use of graphs, charts, and equations.	
(3)	Scientific processes. The student uses critical thinking, scientific reasoning, and problem solving to make informed decisions within and outside the classroom. The student is expected to:	
(A)	analyze, evaluate, and critique scientific explanations by using empirical evidence, logical reasoning, and experimental and observational testing, so as to encourage critical thinking by the student;	
(B)	communicate and apply scientific information extracted from various sources such as current events, news reports, published journal articles, and marketing materials;	
(C)	explain the impacts of the scientific contributions of a variety of historical and contemporary scientists on scientific thought and society;	
(D)	research and describe the connections between physics and future careers; and	
(E)	express, manipulate, and interpret relationships symbolically in accordance with accepted theories to make predictions and solve problems mathematically.	
(4)	Science concepts. The student knows and applies the laws governing motion in a variety of situations. The student is expected to:	
(A)	analyze generate and interpret graphs and charts describing in order to different types of motion <u>by generating and interpreting position versus time, velocity versus time, and acceleration versus time graphs investigations using hand graphing and</u> real-time technology such as motion detectors, or photogates, <u>or digital applications;</u>	Standard was revised to make explicit the appropriate graphs to be used in instruction of different types of motion.
(B)	<u>define scalar and vector quantities related to one- and two-dimensional motion and combine vectors using both graphical vector addition and the Pythagorean theorem;</u>	Group wanted to make teaching vectors an explicit lesson for instruction as well as to align with the co-requisite of Algebra I.
(C)(B)	describe and analyze motion in one dimension using equations and graphical vector addition with the concepts of distance, displacement, speed, average velocity, instantaneous velocity, frames of reference, and acceleration;	Group moved graphical vector addition to 4B and deleted average velocity and instantaneous descriptors to make less redundant.
(D)(E)	analyze and describe accelerated motion in two dimensions <u>of horizontally launched projectiles including</u> using equations and graphical vector addition, and projectiles and circular examples; and	Expectation was revised to provide clarity to the types of projectiles. Multiple Viewpoints: “using equations vs conceptual understanding”

Science TEKS Review Work Group B Final Recommendations

(E)	<u>apply and explain the concepts of equilibrium and inertia as represented by Newton’s first law of motion using relevant real-world examples such as rockets, satellites, and automobile safety devices;</u>	The group ultimately decided to break old 4(D) into separate expectations to address each of Newton’s three laws. The rationale behind the changes to 4(D) as well as adding additional student expectations to D was to make explicit connections between engineering design principles where applicable as well as to clarify the mathematics to keep it from being an impediment to learning for students taking physics at any grade level, including grade 9. The group formulated suggested new expectations E, F and G.
(F)	<u>calculate the effect of forces on objects, including tension, friction, normal, gravity, and applied forces, using free body diagrams and the relationship between force and acceleration as represented by Newton’s second law of motion;</u>	
(G)	<u>illustrate and analyze the simultaneous forces between two objects as represented in Newton’s third law of motion using free body diagrams and in an experimental design scenario; and</u>	
(H)	describe and <u>calculate, using scientific notation, how the magnitude of force between two objects depends on their masses and the distance between their centers, and predict the effects on objects in linear and orbiting systems using Newton’s law of universal gravitation.</u>	The concept in expectation H was moved into KS4 for improved alignment to Newton’s laws as well to make understanding of Newton’s law of universal gravitation more explicit. Group added scientific notation because of the scale of the values in this concept.
(5)	Science concepts. The student knows the nature of forces in the physical world. The student is expected to:	
(A)	describe the concepts of gravitational, electromagnetic, weak nuclear, and strong nuclear forces;	Concepts of gravity refined in a new expectation and moved to KS4. Electromagnetic force kept in KS5 as a separate expectation. Group is evaluating if and how to include strong and weak nuclear forces.
(B)	describe and calculate how the magnitude of the gravitational force between two objects depends on their masses and the distance between their centers;	Moved and revised to 4H for improved content alignment.

Science TEKS Review Work Group B Final Recommendations

<p>(A)-(C)</p>	<p>describe and calculate <u>using scientific notation and predict</u> how the magnitude of the electric force between two objects depends on their charges and the distance between their centers <u>using Coulomb's law</u> ;</p>	<p>Expectation was revised to provide clarity for appropriate calculations to be included in understanding Coulomb's law.</p> <p>Group added scientific notation because of the scale of the values in this concept.</p>
<p>(B)-(D)</p>	<p>identify and describe examples of electric and magnetic forces and fields in everyday life such as generators, motors, and transformers;</p>	
<p>(C)-(E)</p>	<p><u>investigate and describe conservation of charge during the process of induction, conduction, and polarization using different materials such as electroscopes, balloons, rods, fur, silk and Van der Graaf generators;</u></p> <p>characterize materials as conductors or insulators based on their electric properties; and</p>	<p>SE was re-written to better direct the focus on conservation of charge instead of being a repeat of grade level instructional topics.</p>
<p>(D)-(F)</p>	<p><u>design, construct, and analyze, series and parallel circuits using schematics and materials such as switches, wires, resistors, lightbulbs, batteries, voltmeters, and ammeters; and</u></p> <p>calculate current through, potential difference across, resistance of, and power used by electric circuit elements connected in both series and parallel combinations using Ohm's law.</p>	<p>SE was revised to focus on engineering and design principals included in the K-12 framework.</p>
<p>(E)</p>	<p><u>calculate current through, potential difference across, resistance of, and power used by electric circuit elements connected in both series and parallel circuits</u> combinations using Ohm's law.</p>	<p>F was separated into design and construct with a new expectation to emphasize calculation in one expectation and inquiry in the other as well as engineering principles.</p>
<p>(6)</p>	<p>Science concepts. The student knows that changes occur within a physical system and applies the laws of conservation of energy and momentum. The student is expected to:</p>	
<p>(A)</p>	<p><u>calculate and explain work and power in one dimension and recognize when work is and is not being done by or on a system;</u></p>	<p>Work group created separate expectation for work and power to make calculations and understanding more explicit.</p>

Science TEKS Review Work Group B Final Recommendations

(B) (A)	investigate and calculate mechanical, kinetic, and potential energy of a system; investigate and calculate quantities using the work-energy theorem in various situations;	SE was revised to separate and make more explicit from the work-energy theorem and to allow for more hands-on learning with different types of energy.
(C) (B)	apply the concept of conservation of energy using the work-energy theorem, energy diagrams, and energy transformation equations; investigate examples of kinetic and potential energy and their transformations;	SE was revised to allow for connection between energy transformations and the work energy theorem.
(D) (C)	calculate and describe the mechanical energy of, power generated within, impulse applied to, and momentum of a -physical systems using examples such as automobile safety features, athletics, and rockets; and	New expectation created to emphasize conceptual learning and provide clarity and specificity to content to be taught. Mechanical energy and power were moved to other SE's.
(E) (D)	analyze the conservation of momentum in inelastic and elastic collisions in one dimension qualitatively using models, diagrams, and simulations. demonstrate and apply the laws of conservation of energy and conservation of momentum in one dimension; and	New expectation created to emphasize conceptual nature of conservation of linear momentum and to reduce the burden of complex calculations.
(E)	explain everyday examples that illustrate the four laws of thermodynamics and the processes of thermal energy transfer.	Expectation does not align with anything else which is a separate topic. Heat is covered in Chemistry. Topic was removed to allow for additional time to teach other expectations. Chemistry does not include laws of thermodynamics, but workgroup will consider moving/including in their treatment of thermodynamic related expectations.
(7)	Science concepts. The student knows the characteristics and behavior of waves. The student is expected to:	
(A)	examine and describe simple harmonic oscillatory motion, standing waves, and wave energy propagation in various types of media using examples such as springs, pendulums, surface waves on a body of water, and ropes;	Expectation language changed to make explicit the concepts of simple harmonic motion and standing waves to be included in instruction.

Science TEKS Review Work Group B Final Recommendations

(B)	investigate and analyze characteristics of waves, including velocity, frequency, amplitude, and wavelength, and calculate using the <u>relationships relationship</u> between wave speed, frequency, <u>energy</u> , and wavelength;	Expectation changed to include energy and the relationships between different wave characteristics to make more explicit and topic was removed from chemistry to be included in physics.
(C)	<u>compare the different applications of the electromagnetic spectrum;</u>	Group may ask 8th Grade Science TEKS revision workgroup to consider adding understanding of color to SE's related to light behavior. New SE created to highlight real world applications of the electromagnetic spectrum.
(D)	compare and explain <u>investigate the emission spectra produced by various atoms, and explain the relationship to the electromagnetic spectrum;</u>	Moved from KS8 to better organize within the concepts in 8.
(E)-(C)	<u>compare the characteristics of transverse and longitudinal waves including electromagnetic and sound waves;</u> compare characteristics and behaviors of transverse waves, including electromagnetic waves and the electromagnetic spectrum, and characteristics and behaviors of longitudinal waves, including sound waves;	SE was revised to simplify language and reduce redundancy.
(F)-(D)	investigate behaviors of waves, including reflection, refraction, diffraction, interference, resonance, and the Doppler effect; and	Work group would like to consider future recommendations to these SE's to include additional scientific and engineering practices.
(G)-(E)	describe and predict image formation as a consequence of reflection from a plane mirror and refraction through a thin convex lens;	Work group would like to consider future recommendations to these SE's to include additional scientific and engineering practices.
(8)	Science concepts. The student knows simple examples of atomic, nuclear, and quantum phenomena. The student is expected to:	KS deleted to better align with waves.
(H)-(A)	describe the photoelectric effect and the dual nature of light.	SE moved to KS7 F.
(B)	compare and explain the emission spectra produced by various atoms;	EM spectra and quantum covered in chem. Partially combined with new SE in KS7.

Science TEKS Review Work Group B Final Recommendations

(C)	calculate and describe the applications of mass-energy equivalence; and	SE removed to allow for more time to teach the curriculum.
(D)	give examples of applications of atomic and nuclear phenomena using the standard model such as nuclear stability, fission and fusion, radiation therapy, diagnostic imaging, semiconductors, superconductors, solar cells, and nuclear power and examples of applications of quantum phenomena.	Moved to Chemistry per work group discussion.

DRAFT
