## Executive Summary

This study examines the robustness of the models programmed with the field-test data on the operational responses and scores using Spring 2023 State of Texas Assessments of Academic Readiness (STAAR®) items and data. The study found that the tested Automated Scoring Engine met sufficient performance criteria on each of the field-test programmed and operationally programmed held-out validation samples. We expect that the results of the study will generalize to future administrations starting in December 2023.

Models programmed on the sample of the first $50 \%$ of the operational data in the program met sufficient performance criteria for all students and for the five student groups evaluated: Male, Female, Black, Hispanic/Latino, and White.

Under current administration conditions, models will need to be reprogrammed on the operational data during the scoring window. Moving forward, we will plan that all models for all items be reprogrammed on the operational data, regardless of performance. Once deployed, all responses are rescored with the newly reprogrammed model and with any newly determined condition codes or low confidence responses routed for human scoring.

An automated score will never be used in the human scoring process; rather, any response routed for human scoring or hand-scoring use spring 2023 hand-scoring rules to assign scores. This approach will better support engine reprogramming on the operational data allowing for a direct comparison of the engine to humans. Additionally, any scores assigned during human scoring are considered the score of record; all other responses receive the score assigned by the reprogrammed model.

Additional work will continue to further refine the condition codes and thresholds used. These will likely vary by item type and grade and will undergo review and analysis to ensure alignment to the scoring rubric and human-assigned condition codes.

## Introduction

The purpose of this study is to examine the robustness of automated scoring models on the STAAR operational data and to conduct further analysis on the modeling to prepare for the operational hybrid automated/human scoring starting in December 2023 for STAAR end-of-course (EOC) assessment items and continuing through spring 2023 for STAAR grade 3-8 items. Spring 2023 items and data were used to examine engine performance in an operational setting under the assumption that these results will generalize to future administrations. The benefit of this approach is that all responses received human scores in spring 2023, so various configurations around hybrid automated/human scoring can be examined. It is important to note that STAAR items administered as part of the spring summative assessment are released that same year, and so are not available for future use. This means that the models programmed in this study cannot be used in any future administration.

The key elements of the approach are as follows. First, we assume that the initially deployed models are programmed on field-test data. These models are then evaluated for performance on a random verification sample that has been routed for human scoring. If models perform well against key criteria, we can assume they are performing adequately across all responses. Otherwise, models need to be reprogrammed on the operational data and then redeployed to score all new and any previously scored responses. The analysis approach involves multiple phases.

- In Phase 1, models are programmed on the field-test data for all spring 2023 items and performance is evaluated using key criteria.
- In Phase 2, models are applied to a representative sample of spring 2023 operational data, and routing categories that mimic potential operational use are defined. These categories are automated scoring engine-assigned condition codes, random verification sample ( $15 \%$ ), responses with low confidence values ( $10 \%$ ), and all remaining responses. It is assumed that the first three categories are either routed for human review or are accurately scored. The last category is assumed to be rubric-valid responses for which the automated scoring engine would be the sole scorer.
- In Phase 3, the performance of the engine is examined on the random verification sample and evaluated relative to the key criteria.
- In Phase 4, models are reprogrammed on the first $50 \%$ of the verification sample and evaluated relative to key criteria.
- In Phase 5, reprogrammed models are applied to the remaining responses, and any new low confidence and automated scoring engine-assigned condition code responses are identified.
- In Phase 6, the performance of the reprogrammed engine is examined on the remaining responses.

The results of the study will be used to make recommendations around the adequacy of autoscoring in the STAAR program and to inform decisions around the hybrid automated/human scoring configurations. They also illustrate the proportion of items needing to be reprogrammed within the operational scoring window.

## Method

## Items

The items administered in each program are presented in Table 1 along with information on the program, item type, rubric score points, and number of responses in the field test and operational test (OP). There are 27 STAAR items. Eight items are extended constructed-response (ECR) items, and the remaining 19 items are short constructed-response (SCR) items. The number of responses available for programming the automated scoring engine from the STAAR Stand-Alone Field Test (SAFT) in 2022 is quite low for most reading language arts (RLA) items (ranging from 1,182 to 2,871 ), particularly ECRs, compared to what is recommended ( $2,500-4,000$ ). ${ }^{1}$ The science and social studies items have sample sizes recommended for engine programming with the exception of items 71344 and 60001.

Table 1. STAAR Open-Ended Items Administered in Spring 2023

| Grade | Item ID | Type | Program | Subject | Score points | SAFT N | OP N |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 9 | 68776 | ECR | STAAR EOC | RLA | Conv: 2, Ideas: 3 | 1267 | 463011 |

Note. ECR scores are reported to educators on a summed scale using the resolution rules outlined for hand-scoring.

## Hand-scoring

Hand-scoring rules varied by administration and item type. Table 2 and Table 3 outline the scoring rules associated with each administration and item type.

All field-test scoring was conducted in spring and summer 2022. For the field test, all items underwent scoring by two independent readers with resolution of non-exact scores. The purpose of this approach was to obtain high-quality scores with which to program the engine and to calibrate item parameters.

All spring 2023 operational scoring occurred within the defined operational scoring windows. For the spring 2023 operational tests, SCRs had only a portion of responses ( $25 \%$ ) routed for a second read; any non-exact scores for this subset were routed for expert resolution. ECRs had two independent readers with resolution of non-adjacent scores.

Table 2. 2022 Field-Test Hand-Scoring Specifications

| Program | Item Type | Scoring Specification |  |
| :--- | :--- | :--- | :--- |
| STAAR | RLA 1-point SCR | 1. All SAFT Writing FT SCRs will be scored by at least 2 scorers. <br> 2. <br> Resolution is required for any scores not in perfect agreement. |  |
| STAAR | RLA, Social <br> Studies, Science <br> 2-point SCR | 1. $\quad$All SAFT Reading, Social Studies, and Science SCRs will be scored by at <br> least 2 scorers. <br> STAAR <br> 2. Resolution is required for any scores not in perfect agreement. |  |

Table 3. Spring 2023 Operational Hand-Scoring Specifications

| Program | Item Type | Scoring Specification |
| :---: | :---: | :---: |
| STAAR | RLA 1-point SCR | 1. Writing SCRs will be scored by one scorer (R1). <br> 2. $25 \%$ will get a second score (R2). <br> 3. Resolution (R3) is required for any scores not in perfect agreement. R3 is the final score if present. <br> 4. $\mathrm{R} 1 / \mathrm{R} 2$ or R 3 score of record is the final score and should not be doubled. |
| STAAR | RLA, Social Studies, Science 2-point SCR | 1. Reading, Social Studies, and Science SCRs will be scored by one scorer (R1). <br> 2. $25 \%$ will get a second score (R2). <br> 3. Resolution (R3) is required for any scores not in perfect agreement. R3 is the final score if present. <br> 4. $\mathrm{R} 1 / \mathrm{R} 2$ or R 3 score of record is the final score and should not be doubled. |

| Program | Item Type | Scoring Specification |
| :---: | :---: | :---: |
| STAAR | ECRs | 1. $100 \%$ of responses will be independently scored by 2 readers: Reader 1 (R1, Initial Read) and Reader 2 (R2, Reliability Read). <br> 2. Scorer agreement will be evaluated at the trait level to determine whether a third resolution read ( R 3 , Resolution Read) is required. <br> a. If R1 and R2 have exact agreement or adjacent numerical scores, no further reads will be conducted. <br> b. If R1 and R2 scores are not adjacent, or one reader assigns a numerical score and the other a condition code, the response is sent for R3. <br> c. If R1 and R2 assign different condition codes, the response is sent for R3. <br> d. All responses that are identified as nonscorable and assigned a condition code (excluding blanks) are routed for verification by a supervisor or scoring director. <br> 3. If R3 is not present, then a final trait score is calculated by adding R1 score and R2 score. If R3 score is present, the R3 score is doubled for the final score. |

The human assigned condition codes for STAAR appear in Table 4.

## Table 4. STAAR Human-Assigned Condition Codes

| B = Blank |
| :--- |
| T = Off Topic |
| I = Indecipherable |
| U = Illegible |
| F = Written in a language other than tested language |
| D = Insufficient response |
| C = Lacks any original writing |
| P = Does not write in prose |
| R = Refuses to write |

## Description of the Automated Scoring Engine

The automated scoring engine has demonstrated capability to produce comparable results to humans across a variety of item types and grades. The use of automated scoring helps to ensure that scores are returned quickly, at lower cost, and ensures consistency in scoring within and across administrations. This technology is currently used in six state-level summative programs and fourteen state-level interim programs.

The automated scoring engine uses features associated with writing quality and features associated with response meaning. Writing quality features include measures of syntax, grammatical/mechanical correctness, spelling correctness, text complexity, paragraphing quality, and sentence variation and quality. We build two models in parallel and combine the outputs of these models to predict the response score. Ensembling generally produces better performance than the use of a single model (Zhou et al., 2002).

The automated scoring engine also produces condition codes and confidence values as part of its scoring process. Each method is useful in identifying non-attempts, unusual responses, or
borderline responses that can be routed for human verification scoring. Condition codes include those indicating that a response is blank, uses too few words, uses mostly duplicated text, is written in another language, consists primarily of stimulus material or the stem, uses vocabulary that does not overlap with the sample used to program the engine, or uses language patterns that are reflective of the set of human-assigned condition code responses (Table 5). The automated scoring engine also has a condition code that can be used to capture unusual scoring patterns, such as very short responses receiving scores greater than the lowest rubric score. Finally, the thresholds for the engine condition codes are undergoing continual review and will be revised when necessary.

Table 5. STAAR Automated Scoring Engine Condition Codes

| Condition Code | Description | Threshold |
| :---: | :---: | :---: |
| No Response | Response was empty or consisted only of white space (space characters, tab characters, return characters). | N.A. |
| Duplicate Text | Response contains a significant amount of duplicate or repeated text. | 0.7 |
| Prompt Copy Match | Response consists primarily of text from the passage. | 0.9 SCRs, 0.8 ECRs |
| Non-Scorable Language | Response is in Spanish (must be at least 30 characters). | N.A. |
| Refusal to Respond | Response is of the form "I don't know" or "I don't care." | N.A. |
| Not Enough Data | Response has too few words to be considered a valid attempt. | Varies by SCRs, 11 for ECRs |
| Unusual Vocabulary | Most words in the response do not appear in typical responses. | 0.5 |
| Non-Specific | Response displays characteristics of condition codes assigned by humans that do not fall under the above condition code categories. | N.A. |
| Unusual Score | Response has unusual score pattern characteristics (i.e., non-adjacent scores in related dimensions, high scores for brief responses). | ECRs only |

The confidence value reflects the degree to which the automated scoring engine is confident in the score it has predicted. A high confidence value indicates that the engine is confident in its prediction; a low confidence value indicates that the engine is less confident in its prediction. The confidence values are calculated as percentiles. The confidence model is programmed (using probit regression) to predict whether the engine score matches the final human score on the held-out validation sample ( $1=$ match, $0=$ non-match) using the patterns of model outputs as predictors. A model is programmed for each dimension; if there are multiple dimensions as with ECRs, the confidence outputs are standardized and summed to provide an overall item confidence score.

## Model Programming

CAI programs models for each item and dimension. Data are divided into programming and heldout validation sets with $85 \%$ of responses used to program the engine and $15 \%$ used to evaluate the engine performance. Data are stratified on the final, resolved score to ensure that score point distributions are evenly represented in both sets. Human-assigned condition codes are removed
prior to programming the models and are added later in the process when applying the automated scoring engine condition codes.

For SCRs, models are programmed on the final, resolved score arising out of the hand-scoring process. For ECRS because of the summed score approach used in hand-scoring, two different models are programmed independently-one on human rater 1 and one on human rater 2. These scores are combined within dimension to produce a summed score. This summation occurred on the probabilities whereby the probability of the summed score is the sum of the products of the model probabilities for all possible sums of the summed score. For example, the probability of a summed score of 2 is the sum of the following products: $\mathrm{P}_{\text {model1 }}(0) * \mathrm{P}_{\text {model2 }}(2)+\mathrm{P}_{\text {model1 }}(1) * \mathrm{P}_{\text {model2 }}(1)+\mathrm{P}_{\text {model1 }}(2) * \mathrm{P}_{\text {model2 }}(0)$. The final score in the summed scale is the argmax of the probabilities, or the score associated with the highest probability.

## Evaluation Metrics

Metrics used to examine engine performance are those commonly used in the assessment industry (Williamson, Xi, and Breyer, 2012). These include measures of agreement (Exact Agreement, Quadratic Weighed Kappa [QWK] using Fleiss-Cohen weights) and a distributional measure (Standardized Mean Difference [SMD] using pooled standard deviation).

Definitions for these terms are:

1. Exact Agreement - Represents the percentage of responses for which two raters agree on the score. A score of $100 \%$ indicates perfect agreement across all responses, and a value of $0 \%$ indicates that there was no agreement at all. We expect human-machine (HS-AS) Exact Agreement to be no less than $5.25 \%$ of the human-human (H1-H2) exact agreement rate.
2. QWK—Also referred to as Cohen's kappa or a kappa value, provides a measure of agreement where a value of 1 represents perfect agreement and a value of 0 indicates random chance. Additionally, QWK considers the magnitude of disagreements. If two raters disagree by more than one score point, (for example, one rater assigns a score of 1 and the other assigns a score of 3 ) this is penalized more than a disagreement of just one score point. Hence, the term quadratic weighted describes the penalty assigned for such extreme disagreements. We expect item traits will be such that the HS-AS QWK is no less than 0.10 the H1-H2 QWK.
3. SMD—Helps us determine if the two rater groups are scoring differently from one another without having to know the scale of a particular test item. To calculate the SMD, we first compute the mean score assigned by each rater. Then we take the difference between the two. In order to obtain a value that can be interpreted across all items, we divide the difference of means by how much variation in scores we see in the entire dataset. A value of 0 indicates that there is no discernible difference in scores assigned by human raters and by an automated scoring model. We expect item traits to differ by no more than a magnitude of 0.15 .

CAI used the following thresholds to identify poorly performing items:

- Engine-Final, resolved score exact agreement lower than $5.25 \%$ of $\mathrm{H} 1-\mathrm{H} 2$ exact agreement (PARCC, 2015),
- Engine-Final, resolved QWK lower than 0.1 of H1-H2 QWK (Williamson et al., 2012), and
- Engine-Final, resolved SMD magnitude greater than 0.15 (Williamson et al., 2012).

For ECR summed scores, there is no comparable H1-H2 agreement, so only two measures are used:

- Engine-Final, resolved QWK greater than 0.7 (Williamson et al., 2012) and
- Engine-Final, resolved SMD magnitude greater than 0.15 (Williamson et al., 2012).

For each item type and scoring, two sets of results are presented: 1) the average QWK, exact agreement, and SMD values for the two human raters and for the engine and final resolved score; and 2) the percentage of items passing performance thresholds.

Finally, the application of the metrics was conducted on the sample of response in which both automated scoring engine and human-assigned condition codes were removed. This approach was taken because the final determination of the condition codes and thresholds was not yet determined and because the core focus is on the ability of the engine to reproduce human scores.

## Field-Test and Operational Scores

Prior to engine programming, the final score distribution data was computed and compared between the field-test and operational hand-scored data. The purpose of this analysis is to identify similarities and differences between the two samples as a first step toward understanding and explaining model performance on the two samples. Models whose programming data are similar in terms of means, standard deviations, and score point distributions relative to the operational data are likely to perform well assuming sufficient programming sample sizes. Models whose programming data differ may result in poorer performance on the operational data because this suggests possible differences in hand-scoring or in how students are responding to items. Assuming the hand-scoring rules and the response characteristics are similar between the field-test and the operational test, the models are likely to perform well.

For detailed results, refer to Appendix A: Field-Test and Operational Score Distributions. In STAAR, the operational RLA SCRs generally showed higher mean scores with SMD values ranging from 0.20 to 0.57 . Science SCRs showed more varied performance with an SMD range of -0.17 to 0.21 and three items having lower operational means than field-test means. Social studies SCRs also showed varied performance with an SMD range of -0.27 to 0.40 and two items having lower operational means than field-test means. STAAR ECRs showed mostly higher operational means across items and across the two dimensions; the conventions SMDs ranged from -0.01 to 0.54 , and the ideas SMDs ranged from 0.08 to 0.56 .

These data suggest models programmed on the field-test data alone may not perform well on operational data except for some STAAR RLA SCRs. As a result, TEA uses operational data to train the engine in order to maximize accuracy of student scores.

## High-Level Overview of the Study Method

Figure 1 provides a high-level overview of the study method. The Results section below is organized into these phases, and they are reiterated below for clarity given the complexity of the analysis.

- In Phase 1, automated scoring engine models were programmed and evaluated on the fieldtest data.
- In Phase 2, these programmed models were used to score a sample of operational responses. For STAAR, a random sample of $25 \%$ of responses, stratified by administration date, were used. These percentages were chosen to ensure sufficient sample sizes for reprogramming models on the operational data. These field-test programmed models were then used to score the random sample. From these samples, four routing categories were identified: 1) those receiving condition codes by the automated scoring engine, 2) a verification sample of responses chosen to be $15 \%$ stratified by date, 3 ) responses receiving engine confidence percentile values less than 10 , and 4) remaining responses. These categories and thresholds were chosen to mimic a possible operational hybrid automated/human scoring approach. In such an approach, the verification sample and low confidence samples would be routed for human scoring. A subset of condition codes would also be routed for human scoring. The responses in category 4 , remaining responses, were assumed to be scored only by the engine.
- In Phase 3, the model performance was evaluated on the verification sample.
- In phase 4, models were reprogrammed on the first $50 \%$ of the verification sample with $15 \%$ of that sample held out for model evaluation. This sample was chosen to mimic the fact that the engine performance would be monitored early in the window and, if not performing well, would be reprogrammed on a substantial portion of the verification sample that was considered reasonably representative of the set of testers throughout the administration.
- In Phase 5, the reprogrammed models were deployed and used to rescore the category 4 responses with any new automated scoring engine condition codes and low confidence responses routed for human scoring.
- In Phase 6, the performance of the engine on responses was examined. In addition, subgroup analysis was computed on student sex (male, female) and student race/ethnicity (White, Black, Hispanic). This analysis used the same metrics outlined for evaluating the automated scoring engine within each subgroup category.

Phase 1: Program and Evaluate Engine on FT Data

Phase 2: Score Operational Sample and Identify Categories

Phase 3: Examine Engine Performance on the Verification Sample

Figure 1. Overview of the Study Method

## Results

The results are divided into the six phases of the study.

## Phase 1: Field-Test Programmed Model Performance on Field-Test Data

Across the STAAR item types, the automated scoring engine met the performance criteria for almost all items with two items failing at least one criterion (STAAR RLA SCR item 80822 and STAAR ECR item 55391). The results are presented by program and item type. For each program and item type, the QWK, exact agreement, and SMD results are presented first followed by the percentage of items meeting the performance criteria.

## Phase 1: STAAR SCRs

The automated scoring engine showed similar QWK and exact agreement with the final, resolved score relative to the two human raters (Table 7). The standardized mean differences between the engine and the final, resolved score ranged from -0.17 (80822) to 0.10 (73863). On average across the items, the engine assigned slightly higher mean scores as indicated by a negative SMD value relative to the final, resolved score. Ninety percent of the RLA SCRs met the three thresholds, and all science and social studies SCRs met the three thresholds (Table 8).

Table 6. Phase 1 AS Performance on STAAR SCRs

| Item ID | Score <br> Point | N | QWK          <br>           <br>   H1H2 HSAS Diff. H1H2 HSAS Diff. H1H2 HSAS <br> 79024          <br> RLA          <br> 78742          |  |  | 1 | 330 | 0.87 | 0.85 | -0.01 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table 7. Phase 1 Percentage of STAAR SCRs Passing Performance Thresholds

| Subject | N Items | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RLA | 10 | $100 \%$ | $100 \%$ | $90 \%$ | $90 \%$ |
| Science | 5 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |
| Social Studies | 4 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |

## Phase 1: STAAR ECRs

Recall that ECR reported item scores are double the rubric score values for each dimension and represent the sum of rater scores. Recall also that the field-test programming sample sizes were smaller than what is typically used in engine programming.

Engine QWK values were greater than 0.70 for all items, and SMD values had a magnitude less than 0.15 except for item 55391 (Table 9). Aside from item 55391, the QWK values ranged from 0.73 to 0.89 for conventions and from 0.73 to 0.91 for ideas. Again ignoring item 55391, SMD values ranged from -0.04 to 0.06 for conventions and -0.03 to 0.07 for ideas. For RLA ECRs,
87.5\% met the three thresholds (Table 10). Engine performance for each model appears in Appendix B: STAAR ECR Individual Model Performance Tables B1 and B2.

Table 8. Phase 1 AS Performance on STAAR ECRs

| Item ID | N | QWK | Exact Agr. | Adj. <br> Agr. | NonAdj. Agr. | SMD | Mean |  | SD |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 68776 | 173 | 0.77 | 58\% | 27\% | 15\% | 0.02 | 2.35 | 2.32 | 1.66 | 1.68 |
| Avg. |  | 0.78 | 58\% | 33\% | 9\% | 0.04 |  |  |  |  |
| Ideas |  |  |  |  |  |  |  |  |  |  |
| 55391 | 129 | $\underline{0.70}$ | 53\% | 36\% | 11\% | 0.12 | 1.29 | 1.14 | 1.28 | 1.13 |
| 12632 | 155 | 0.77 | 47\% | 41\% | 12\% | 0.07 | 1.66 | 1.56 | 1.56 | 1.38 |
| 12638 | 160 | 0.73 | 38\% | 48\% | 15\% | 0.02 | 2.05 | 2.02 | 1.57 | 1.45 |
| 12666 | 173 | 0.79 | 45\% | 41\% | 14\% | -0.03 | 2.22 | 2.27 | 1.67 | 1.76 |
| 73118 | 204 | 0.91 | 67\% | 27\% | 6\% | 0.05 | 1.60 | 1.52 | 1.73 | 1.70 |
| 73991 | 187 | 0.89 | 53\% | 39\% | 8\% | -0.01 | 1.99 | 2.01 | 1.83 | 1.76 |
| 68583 | 198 | 0.89 | 53\% | 38\% | 9\% | 0.03 | 2.36 | 2.31 | 1.89 | 1.89 |
| 68776 | 173 | 0.84 | 51\% | 35\% | 13\% | 0.02 | 2.18 | 2.14 | 1.71 | 1.77 |
| Avg. |  | 0.81 | 51\% | 38\% | 11\% | 0.03 |  |  |  |  |

Note. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table 9. Phase 1 Percentage of STAAR ECRs Passing Performance Thresholds

| N Items | Dimension | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | Conventions | $87.5 \%$ | N.A. | $87.5 \%$ | $87.5 \%$ |
| 8 | Ideas | $87.5 \%$ | N.A. | $100 \%$ | $87.5 \%$ |

## Phase 2: Operational Sample Scoring Categories Using FT-Programmed Models

After engine programming and validation on the field-test data, models were deployed to scoring environments and the operational subsamples of responses were scored by the engine. Following scoring, responses were categorized into those responses receiving engine condition codes, verification samples ( $15 \%$ determined randomly by day), low confidence (threshold less than 10),
and the remaining responses (AS). The total N count of scored responses and the percentage in each category are presented in Table 11.

The percentage of engine condition codes will vary depending upon the condition codes and thresholds used. Thus, the percentages displayed for STAAR should be interpreted with caution as the condition codes are provisional and yet to be finalized. Note also that a subset of the condition codes will be routed for human scoring in an operational setting.

The low confidence percentages for items should be around 10 since the percentile threshold was set to 10 , which is the case for many items. However, there are thirteen STAAR items for which the low confidence percentages are more than $2 \%$ above or below $10 \%$. This is likely due to a mismatch between the field-test sample responses and the operational sample responses, low N counts for engine programming, and distributional elements of the field-test sample. Items with the percentages outside of $+/-2 \%$ of expected low confidence percentage are underlined in the table.

Table 10. Phase 2 Percentage of Responses in the Four Categories for STAAR Items

| Item ID | Subject | Type | $\mathbf{N}$ | Category |  |  |  |

| 68583 | RLA | ECR | 127445 | $7 \%$ | $14 \%$ | $\underline{6 \%}$ | $73 \%$ |
| 68776 | RLA | ECR | 115780 | $5 \%$ | $14 \%$ | $8 \%$ | $72 \%$ |

Note. CC = Condition Code.

## Phase 3: Field-Test Programmed Model Performance on Operational Verification Data

Across item types, the automated scoring engine failed the performance criteria for many items on the operational verification data. Specifically, only $60 \%$ of STAAR RLA SCRs and $37.5 \%$ of ECRs met the performance criteria, and no science or social studies SCRs met the performance criteria.

## Phase 3: STAAR SCRs

The automated scoring engine displayed generally lower QWK and exact agreement with the final, resolved score compared to the two human raters (Table 12). For some items, the engine-human QWK or exact agreement was much lower, such as for items 81164, 60001, 72436, and 72439. The SMD values tended to be negative across items indicating that the automated scoring engine assigned higher mean scores compared to the final, resolved scores. For some items, the SMD magnitude was quite large, exceeding 0.30 in magnitude ( $81164,79244,60001,55826,72841$, 72436, and 72439). Only $60 \%$ of the RLA SCRs met the three thresholds in the verification data, and none of the science and social studies SRCs met the thresholds (Table 13).

Table 11. Phase 3 AS Performance on STAAR SCRs

| Item ID | Score <br> Point | N | QWK |  |  | Exact Agreement |  |  | SMD |  |

| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | H1H2 | HSAS | Diff. | H1H2 | HSAS | Diff. | H1H2 | HSAS |
| 71344 | 2 | 14350 | 0.91 | 0.85 | -0.06 | 88\% | 81\% | -7\% | 0.00 | 0.01 |
| 60001 | 2 | 13846 | 0.82 | 0.65 | $\underline{-0.17}$ | 82\% | 64\% | -18\% | 0.01 | -0.31 |
| 74531 | 2 | 13201 | 0.97 | 0.92 | -0.05 | 97\% | 91\% | -5\% | 0.00 | -0.01 |
| Avg |  |  | 0.89 | 0.79 | -0.10 | 89\% | 80\% | -9\% | 0.00 | -0.14 |
| Social Studies |  |  |  |  |  |  |  |  |  |  |
| 55826 | 2 | 13435 | 0.62 | 0.56 | -0.06 | 62\% | 58\% | -4\% | 0.01 | 0.30 |
| 72841 | 2 | 13215 | 0.55 | 0.56 | 0.00 | 62\% | 59\% | -2\% | 0.01 | -0.40 |
| 72436 | 2 | 14317 | 0.82 | 0.69 | -0.14 | 80\% | 69\% | -11\% | -0.01 | -0.41 |
| 72439 | 2 | 13879 | 0.81 | 0.65 | -0.17 | 80\% | 61\% | -19\% | -0.02 | -0.48 |
| Avg |  |  | 0.70 | 0.61 | -0.09 | 71\% | 62\% | -9\% | 0.00 | -0.25 |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold. STAAR SCRs had a $25 \%$ second read, so the human agreements were based upon a smaller sample.

Table 12. Phase 3 Percentage of STAAR SCRs Passing Performance Thresholds

| Subject | N Items | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RLA | 10 | $70 \%$ | $60 \%$ | $60 \%$ | $60 \%$ |
| Science | 5 | $60 \%$ | $0 \%$ | $40 \%$ | $0 \%$ |
| Social Studies | 4 | $50 \%$ | $50 \%$ | $0 \%$ | $0 \%$ |

## Phase 3: STAAR ECRs

The automated scoring engine had QWK agreements exceeding 0.70 in the conventions and ideas dimensions except for items 55391 and 12632. Non-adjacent agreements were quite high for some items, exceeding $15 \%$ for six items and dimensions. The SMD magnitudes exceeded 0.15 for eight items (Table 14). SMD magnitudes exceeded 0.3 for four items and dimensions. As with the STAAR SCRs, the SMD were mostly negative; the engine assigned higher mean scores compared to the final, resolved score. Fifty percent of the items met all criteria for the conventions dimension and $37.5 \%$ met all criteria for the ideas dimension (Table 15). Engine performance for each model appears in Appendix B: STAAR ECR Individual Model Performance Tables B3 and B4.

Table 13. Phase 3 AS Performance on STAAR ECRs

| Item ID | N | QWK | Exact Agr. | Adj. <br> Agr. | Non- | SMD | Mean |  | SD |  |

| 12666 | 13636 | 0.83 | 42\% | 39\% | 19\% | -0.30 | 2.76 | 3.37 | 1.96 | 2.03 |
| 73118 | 14248 | 0.88 | 49\% | 38\% | 12\% | 0.02 | 2.67 | 2.63 | 1.86 | 2.13 |
| 73991 | 14412 | 0.91 | 53\% | 39\% | 8\% | -0.01 | 2.90 | 2.92 | 2.02 | 2.08 |
| 68583 | 17525 | 0.89 | 51\% | 39\% | 10\% | 0.01 | 2.91 | 2.89 | 1.95 | 2.04 |
| 68776 | 16234 | 0.87 | 48\% | 38\% | 13\% | -0.18 | 2.89 | 3.25 | 2.04 | 2.08 |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table 14. Phase 3 Percentage of STAAR ECRs Passing Performance Thresholds

| N Items | Dimension | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | Conventions | $75 \%$ | N.A. | $62.5 \%$ | $50 \%$ |
| 8 | Ideas | $75 \%$ | N.A. | $37.5 \%$ | $37.5 \%$ |

## Phase 4: Reprogrammed Model Performance on Verification Held-out Data

In phase 4 , models were reprogrammed on the first $50 \%$ of the verification sample with $15 \%$ of that sample held out for model evaluation. This programming sample was chosen to mimic the fact that the engine performance would be monitored early in the window and, if not performing well, would be reprogrammed on a substantial portion of the verification sample that was considered reasonably representative of the set of testers throughout the administration. The automated scoring engine met the performance criteria for all items.

## Phase 4: STAAR SCRs

The automated scoring engine had similar QWK and exact agreement with the final, resolved score relative to the two human raters (Table 16). The standardized mean differences between the engine and the final, resolved score ranged from -0.10 to 0.02 with many items exhibiting slightly negative SMD. In other words, the engine is assigning slightly higher mean scores for most items, but those values are close to zero. All STAAR SCRs met the three thresholds (Table 17).

Table 15. Phase 4 AS Performance on STAAR SCRs

| Item ID | Score <br> Point | N | QWK |  |  | Exact Agreement |  |  | SMD |  |

| 74531 | 2 | 986 | 0.96 | 0.98 | 0.02 | 96\% | 97\% | 2\% | 0.02 | -0.01 |
| Avg |  |  | 0.90 | 0.89 | 0.00 | 89\% | 89\% | 0\% | 0.00 | -0.01 |
| Social Studies |  |  |  |  |  |  |  |  |  |  |
| 55826 | 2 | 1006 | 0.54 | 0.68 | 0.14 | 53\% | 65\% | 12\% | -0.09 | -0.10 |
| 72841 | 2 | 992 | 0.57 | 0.63 | 0.06 | 64\% | 68\% | 4\% | 0.05 | -0.02 |
| 72436 | 2 | 1073 | 0.84 | 0.83 | -0.02 | 82\% | 81\% | -1\% | 0.03 | 0.00 |
| 72439 | 2 | 1041 | 0.83 | 0.83 | -0.01 | 82\% | 82\% | 0\% | 0.01 | -0.01 |
| Avg |  |  | 0.70 | 0.74 | 0.04 | 70\% | 74\% | 4\% | 0.00 | -0.03 |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold. STAAR SCRs had a $25 \%$ second read, so the human agreements were based upon a smaller sample.

Table 16. Phase 4 Percentage of STAAR SCRs Passing Performance Thresholds

| Subject | N Items | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: | :---: |
| RLA | 10 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |
| Science | 5 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |
| Social Studies | 4 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |

## Phase 4: STAAR ECRs

For STAAR ECRs, the automated scoring engine had QWK agreements higher than 0.7 for all item dimensions with most QWK agreement values exceeding 0.80 (Table 18). Exact agreement rates varied between $52 \%$ and $61 \%$ for conventions and between $48 \%$ and $54 \%$ for ideas. Non-
adjacent agreement values ranged from $6 \%$ to $11 \%$ for conventions and from $6 \%$ to $12 \%$ for ideas. The SMD between the engine and the final, resolved score ranged from -0.10 to 0.02 for conventions and from -0.05 to 0.04 for ideas. All STAAR ECRs met the two thresholds (Table 19). Engine performance for each model appears in Appendix B: STAAR ECR Individual Model Performance Tables B5 and B6.

Table 17. Phase 4 AS Performance on STAAR ECRs

| Item ID | N | QWK | Exact Agr. | Adj. <br> Agr. | Non- <br> Adj. <br> Agr. | SMD | Mean |  | SD |  |

| Avg. |  | 0.83 | 55\% | 37\% | 8\% | -0.03 |  |  |  |  |
| Ideas |  |  |  |  |  |  |  |  |  |  |
| 55391 | 793 | 0.81 | 53\% | 40\% | 7\% | 0.01 | 1.72 | 1.70 | 1.48 | 1.39 |
| 12632 | 806 | 0.84 | 54\% | 34\% | 12\% | 0.04 | 1.70 | 1.63 | 1.78 | 1.71 |
| 12638 | 965 | 0.83 | 48\% | 41\% | 11\% | -0.02 | 2.42 | 2.44 | 1.76 | 1.63 |
| 12666 | 975 | 0.89 | 50\% | 42\% | 8\% | 0.04 | 2.79 | 2.71 | 1.94 | 1.93 |
| 73118 | 1044 | 0.89 | 54\% | 39\% | 6\% | -0.03 | 2.64 | 2.69 | 1.83 | 1.71 |
| 73991 | 1047 | 0.92 | 54\% | 40\% | 6\% | -0.01 | 2.97 | 2.99 | 2.02 | 2.08 |
| 68583 | 1286 | 0.89 | 50\% | 42\% | 8\% | -0.05 | 2.98 | 3.07 | 1.94 | 1.92 |
| 68776 | 1206 | 0.90 | 50\% | 41\% | 8\% | 0.00 | 2.94 | 2.94 | 2.04 | 2.00 |
| Avg. |  | 0.87 | 52\% | 40\% | 8\% | 0.00 |  |  |  |  |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table 18. Phase 4 Percentage of STAAR ECRs Passing Performance Thresholds

| N Items | Dimension | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 8 | Conventions | $100 \%$ | N.A. | $100 \%$ | $100 \%$ |
| 8 | Ideas | $100 \%$ | N.A. | $100 \%$ | $100 \%$ |

## Phase 5: Operational Sample Scoring Categories Using Reprogrammed Models

After engine reprogramming and validation, models were deployed to the scoring environment, and the remaining AS sample from Phase 2 was rescored using the reprogrammed models. Following scoring, responses were categorized into those responses receiving any new engine condition codes and two low confidence thresholds ( 5 and 10). The total N count of scored responses and the percentage in each category are presented in Table 20.

As expected, the percentage of engine condition codes was very small for STAAR items. The newly assigned condition codes were those that were dependent upon the new data used to program the engine (e.g., Unusual Vocabulary, and Non-Specific). The low confidence values should be around 5 or 10 depending upon the threshold. Because low confidence responses were removed from the AS sample in Phase 2 using the field-test programmed model, it is possible that fewer than the threshold are routed. However, across item types, the percentages were close to the threshold.

Table 19. Phase 5 Percentage of Responses in the Four Categories for STAAR Items

| Item ID | Subject | Type | N | Category |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Machine CC | $\begin{gathered} 5^{\text {th }} \text { Percentile } \\ \text { LC } \end{gathered}$ | $\begin{gathered} 10^{\text {th }} \text { Percentile } \\ \text { LC } \end{gathered}$ |
| 79024 | RLA | SCR | 62667 | 0.24\% | 5\% | 10\% |

|  |  |  |  | $\begin{array}{c}\text { Machine } \\ \text { CC }\end{array}$ | $\mathbf{5}^{\text {th }}$ Percentile | $\mathbf{1 0}^{\text {Lh }}$ Percentile |
| LC |  |  |  |  |$]$

Note. CC = Condition Code. LC = Low Confidence.

## Phase 6: Reprogrammed Model Performance on Operational AS Data

The reprogrammed automated scoring engine models met the performance criteria for all items on the rescored operational AS data. This was true also for the five student group categories (Male, Female, Black, Hispanic/Latino, and White).

## Phase 6: STAAR SCRs

The automated scoring engine showed comparable QWK and exact agreement with the final, resolved score compared to the two human raters (Table 21). The average SMD between the engine and the final, resolved score ranged from -0.07 to 0.02 . Most SMD values were negative indicating that the engine assigned slightly higher mean scores compared to the final, resolved score. All STAAR SCRs met the three performance criteria overall and by student group (Table 22). The model performance by student group for each item is in Appendix C: Subgroup Item-Level Results Tables C1, C2, and C3.

Table 20. Phase 6 AS Performance on STAAR SCRs

| Item ID | Score Point | N | QWK |  |  | Exact Agreement |  |  | SMD |  |

| 60001 | 2 | 69840 | 0.83 | 0.84 | 0.00 | 83\% | 82\% | 0\% | 0.01 | -0.06 |
| 74531 | 2 | 68633 | 0.98 | 0.97 | 0.00 | 97\% | 97\% | 0\% | 0.00 | -0.01 |
| Avg |  |  | 0.90 | 0.89 | 0.00 | 90\% | 90\% | 0\% | 0.00 | -0.03 |
| Social Studies |  |  |  |  |  |  |  |  |  |  |
| 55826 | 2 | 65419 | 0.59 | 0.64 | 0.06 | 61\% | 64\% | 3\% | -0.01 | -0.07 |
| 72841 | 2 | 68073 | 0.58 | 0.65 | 0.07 | 63\% | 68\% | 6\% | -0.01 | -0.03 |
| 72436 | 2 | 75139 | 0.81 | 0.83 | 0.02 | 80\% | 82\% | 2\% | 0.00 | 0.00 |
| 72439 | 2 | 71925 | 0.84 | 0.85 | 0.01 | 82\% | 82\% | 0\% | 0.00 | 0.00 |
| Avg |  |  | 0.70 | 0.74 | 0.04 | 71\% | 74\% | 3\% | 0.00 | -0.02 |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold. STAAR SCRs had a $25 \%$ second read, so the human agreements were based upon a smaller sample.

Table 21. Phase 6 Percentage of STAAR SCRs Passing Performance Thresholds

| Subgroup | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :--- | :--- |
| RLA |  |  |  |  |
| Overall | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |

| White | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |

## Phase 6: STAAR ECRs

The automated scoring engine had generally high QWK agreements for STAAR ECRs with all QWK values greater than 0.80 (Table 23). Exact agreement rates ranged from $52 \%$ to $62 \%$ for conventions and from $51 \%$ to $58 \%$ for ideas. Non-adjacent agreements were $10 \%$ or less for all items and dimensions except item 12632 in ideas. SMD magnitudes varied between -0.08 and 0.01 in conventions and between -0.04 and 0.03 in ideas. All items and dimensions met the two performance criteria overall and by student group (Table 24). Engine performance for each model appears in Appendix B: STAAR ECR Individual Model Performance Tables B7 and B8. Performance by student group for each item is in Appendix C: Subgroup Item-Level Results Table C 4 .

Table 22. Phase 6 AS Performance on STAAR ECRs

| Item ID | N | QWK | Exact <br> Agr. | Adj. <br> Agr. | NonAdj. Agr. | SMD | Mean |  | SD |  |

| 12666 | 65784 | $0.90$ | 52\% | 40\% | 8\% | $0.02$ | 2.85 | 2.80 | 2.02 | 2.02 |
| 73118 | 69048 | $0.90$ | 54\% | 40\% | 6\% | $-0.03$ | 2.74 | 2.80 | 1.91 | 1.83 |
| 73991 | 74461 | $0.92$ | 56\% | 38\% | 6\% | $0.00$ | 3.02 | 3.03 | 2.04 | 2.07 |
| 68583 | 89627 | $0.91$ | 54\% | 39\% | 7\% | -0.04 | 3.01 | 3.10 | 1.98 | 2.01 |
| 68776 | 81190 | 0.91 | 52\% | 40\% | 8\% | -0.01 | 3.00 | 3.03 | 2.07 | 2.07 |

Note. H1H2 refers to human-human agreement. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table 23. Phase 6 Percentage of STAAR ECRs Passing Performance Thresholds

| White | $100 \%$ | N.A. | $100 \%$ | $100 \%$ |

## Conclusion and Next Steps

This study built upon prior studies examining the performance of automated scoring on the STAAR SCRs and ECRs. The purpose of the study was to examine the robustness of the models programmed with field-test data on the operational responses and scores using spring 2023 items and data. We expect that the results of the study will generalize to future administrations beginning in December 2023.

The study found that the automated scoring engine met all or most performance criteria on each of the field-test programmed and operationally programmed held-out validation samples. However, many models programmed with the field-test data did not perform well on the operational data. Specifically, only $60 \%$ of STAAR RLA SCRs and $37.5 \%$ of STAAR ECRs met the performance criteria while none of the STAAR science or social studies SCRs met the performance criteria.

Models programmed on the sample of the first $50 \%$ of the operational data in the program met performance criteria on the non-routed operational data for all students and for the five student groups evaluated (Male, Female, Black, Hispanic/Latino, and White).

These results suggest that, in future administrations, we should expect that most field-test programmed models will not meet the performance criteria and that models will need to be reprogrammed on the operational data. Moving forward, we recommend that all models for all items be reprogrammed on the operational data, regardless of performance. We recommend that field-test programmed models be used initially for operational scoring while routing responses with condition codes, low confidence, and a random verification sample to human scoring. We also recommend that the automated score not be used in the human scoring process; rather, any response routed for hand-scoring use spring 2023 hand-scoring rules to assign scores. This approach will better support engine reprogramming on the operational data, allowing for a direct comparison of the engine to humans. During the operational window, we recommend new models be reprogrammed on the operational data when a sufficient sample size is determined (e.g., minimum of 3,000 to ensure sufficiently large held-out validation samples are used to evaluate performance). Once deployed, we recommend that all responses be rescored using the newly programmed model with any newly determined condition codes or low confidence responses routed for human scoring. Finally, we recommend that any scores assigned during human scoring
be considered the score of record; all other responses receive the score assigned by the reprogrammed model.

Additional work is needed to continue to refine the condition codes and thresholds used. These will likely vary by item type and grade and will undergo review and analysis to ensure alignment to the scoring rubric and human-assigned condition codes.

## Appendix B: STAAR ECR Individual Model Performance

## Phase 1: STAAR ECR Items

Models showed slightly lower QWK and exact agreement with the final, resolved score relative to the two human raters (Table B1). Item 55391 had much worse QWK performance for both models in ideas, and the SMD for model 1 in conventions was large ( 0.41 ). Both models met all criteria for $63 \%$ of the conventions dimensions; model 1 met all criteria for $50 \%$ of the ideas dimension, and model 2 met all criteria for $75 \%$ of the ideas dimension (Table B2). Most failures to meet the criteria in conventions were for the SMD threshold, and most failures in ideas were for exact agreement. Almost all items met the QWK criterion except item 55391.

Table B1. Phase 1 Model Performance on STAAR ECR Items

| Item ID | Model | $\mathbf{N}$ | QWK |  |  | Exact Agreement |  |  | SMD |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| 68583 | 2 | 198 | 0.82 | 0.83 | 0.01 | 67\% | 69\% | 3\% | -0.03 | -0.02 |
| 68776 | 1 | 173 | 0.75 | 0.73 | -0.01 | 65\% | 62\% | -2\% | 0.01 | 0.09 |
| 68776 | 2 | 173 | 0.75 | 0.74 | -0.01 | 65\% | 58\% | -6\% | 0.01 | -0.03 |

Note. HSAS refers to the agreement of engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table B2. Phase 1 Percentage of Models Passing Performance Thresholds

| Model | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: |
| Conventions |  |  |  |  |
| 1 | $100 \%$ | $88 \%$ | $63 \%$ | $63 \%$ |
| 2 | $100 \%$ | $88 \%$ | $75 \%$ | $63 \%$ |

| Model | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: |
| Ideas |  |  |  |  |
| 1 | $88 \%$ | $63 \%$ | $88 \%$ | $50 \%$ |
| 2 | $88 \%$ | $75 \%$ | $100 \%$ | $75 \%$ |

## Phase 3: STAAR ECR Items

Both models showed slightly lower QWK and exact agreement with the final, resolved score relative to the two human raters with large differences for items 55391 and 12632 (Table B3). In conventions, three items had large SMD magnitudes for either model (12632, 12638, and 68776). In ideas, five items had large SMD magnitudes for either model (55391, 12632, 12638, 12666, and 68776).

Model 1 met all the combined criteria for $63 \%$ of the items in both conventions and ideas. Models met all the criteria for $25 \%$ of items in conventions and $38 \%$ in ideas (Table B4). Most model 2 failures were for SMD violations.

Table B3. Phase 3 Model Performance on STAAR ECR Items

| Item ID | Model | N | QWK |  |  | Exact Agreement |  |  | SMD |  |

Note. HSAS refers to the agreement of engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table B4. Phase 3 Percentage of Models Passing Performance Thresholds

| Model | QWK | Exact Agreement | SMD | Combined |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Conventions |  |  |  |  |  |
| 1 | $75 \%$ | $63 \%$ | $75 \%$ | $63 \%$ |  |
| 2 | $75 \%$ | $38 \%$ | $25 \%$ |  |  |
| Ideas | $75 \%$ | $75 \%$ | $63 \%$ | $63 \%$ |  |
| 1 | $75 \%$ | $50 \%$ | $38 \%$ | $38 \%$ |  |

## Phase 4: STAAR ECR Items

Both models showed comparable QWK and exact agreement with the final, resolved score relative to the two human raters, except for item 55391 (Table B5). Model 1 all criteria for $75 \%$ of the Conventions dimensions and Model 2 met all criteria for $63 \%$ of the items, with all violations at the SMD criterion. For Ideas, $88 \%$ of the items met all criteria for Model 1 and $100 \%$ met the criteria for model 2 (Table B6).

Table B5. Phase 4 Model Performance on STAAR ECR Items

| Item ID | Model | N | QWK |  |  | Exact Agreement |  |  | SMD |  |

Note. HSAS refers to the agreement of the engine with the final, resolved score. A positive HSAS SMD means the HS mean is higher than the AS mean. Underlined values indicate violation of a performance threshold.

Table B6. Phase 4 Percentage of Models Passing Performance Thresholds

| Model | QWK | Exact Agreement | SMD | Combined |
| :--- | :---: | :---: | :---: | :---: |
| Conventions |  |  |  |  |
| 1 | $100 \%$ | $88 \%$ | $88 \%$ | $75 \%$ |
| 2 | $100 \%$ | $100 \%$ | $63 \%$ | $63 \%$ |
|  |  |  |  |  |
|  |  |  |  |  |

| Model | QWK | Exact Agreement | SMD | Combined |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $88 \%$ | $88 \%$ | $100 \%$ | $88 \%$ |
| 2 | $100 \%$ | $100 \%$ | $100 \%$ | $100 \%$ |

## Phase 6: STAAR ECR Items

Both models showed comparable QWK and exact agreement with the final, resolved score relative to the two human raters except for item 55391 (Table B7). Model 1 met all criteria for $88 \%$ of the conventions dimensions, and model 2 met all criteria for $100 \%$ of the conventions dimension with all violations at the SMD criterion. For ideas, $88 \%$ of the items met all criteria for model 1, and $100 \%$ met the criteria for model 2 (Table B8).

Table B7. Phase 6 Model Performance on STAAR ECR Items
